

LC²MOS 8-Bit μ P-Compatible 12-Bit DAC

AD7548

FEATURES

8-Bit Bus Compatible 12-Bit DAC
All Grades 12-Bit Monotonic Over Full Temperature Ranges
Operation Specified at +5V, +12V or +15V Power Supply
Low Gain Drift of 5ppm/°C Maximum
Full 4 Quadrant Multiplication
Skinny DIP and Surface Mount Packages

APPLICATIONS

8-Bit Microprocessor Based Control Systems
Programmable Amplifiers
Function Generation
Servo Control

GENERAL DESCRIPTION

The AD7548 is a 12-bit monolithic CMOS D/A converter for use with 8-bit bus microprocessors. Data is loaded in two bytes to input holding registers as shown in the block diagram opposite. The AD7548 can be configured to accept either left- or right-justified data, least significant byte or most significant byte first, using standard TTL compatible control inputs.

A separate load DAC control input allows the user the choice of updating the analog output coincident with loading new data to the DAC input register or at any time after the data loading event. This feature is especially important in multi-DAC systems where simultaneous update of all DACs is required.

The new Linear Compatible CMOS (LC² MOS) process used in the manufacture of the AD7548 allows precision thin-film linear circuitry and high-speed low-power CMOS logic to be integrated on the same small chip. The high-speed logic allows direct interfacing to most of the popular 8-bit microprocessors.

AD7548 FUNCTIONAL BLOCK DIAGRAM

PRODUCT HIGHLIGHTS

- Microprocessor Compatibility**
High speed input control (TTL/5V CMOS compatible) allow direct interfacing to most of the popular 8-bit microprocessors.
- Guaranteed Monotonicity**
The AD7548 is guaranteed monotonic to 12-bits over the full temperature range for all grades and at all specified supply voltages.
- Selectable Data Input Format**
Left- or right-justified data, least significant or most significant byte first. This allows the AD7548 to be interfaced with microprocessors using either Motorola or Intel-type data formatting.
- Monolithic Construction**
For increased reliability and reduced package size – 0.3" 20-pin DIP and 20-terminal surface mount packages.
- Single Supply Operation** – See Figure 8.
- Low Gain Error and Gain Error T.C.**

To +75°C	450mW
Derates above +75°C	6mW/°C

Operating Temperature Range

Commercial (J, K Versions)	0 to +70°C
Industrial (A, B Versions)	–40°C to +85°C
Extended (S, T Versions)	–55°C to +125°C
Storage Temperature	–65°C to +150°C
Lead Temperature (Soldering, 10secs)	+300°C

*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION:

ESD (Electro-Static-Discharge) sensitive device. The digital control inputs are Zener protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The foam should be discharged to the destination socket before devices are removed.

⁵LCCC: Leadless Ceramic Chip Carrier.

GENERAL CIRCUIT INFORMATION

The simplified D/A circuit is shown in Figure 2. An inverted R-2R ladder structure is used, which steers binarily weighted currents between I_{OUT} and AGND, thus maintaining a constant current in each ladder leg independent of the switch state.

The input resistance at V_{REF} is constant and equal to the value "R" in Figure 2. Since the input resistance is constant, the reference terminal can be driven by a reference voltage or a reference current, ac or dc, of positive or negative polarity. (If a current source is used, a low temperature coefficient external R_{FB} is recommended to define scale factor).

Figure 2. AD7548 Simplified Functional Diagram

EQUIVALENT CIRCUIT ANALYSIS

Figure 3 shows an equivalent circuit for the analog section of the AD7548 D/A converter. The current source $I_{LEAKAGE}$ is composed of surface and junction leakages. The resistor R_O denotes the equivalent output resistance of the DAC which varies with input code (excluding all 0's code) from $0.8R$ to $2R$, where R is typically $11k\Omega$. C_{OUT} is the capacitance due to the current steering switches and varies from about $50pF$ to $120pF$ (typical values) depending upon the digital input. $g(V_{REF}, N)$ is the Thevenin equivalent voltage generator due to the reference input voltage, V_{REF} , and the transfer function of R-2R ladder, N .

For further information on CMOS multiplying D/A converters refer to "Application Guide to CMOS Multiplying D/A Converters" available from Analog Devices, Publication Number G479-15-8/78.

Figure 3. AD7548 Equivalent Analog Output Circuit

DATA LOADING

The AD7548 accepts incoming data in either left-justified format or right-justified format depending on the control inputs $DF/\overline{DOR}$ and $CTRL$.

(See pin description of $DF/\overline{DOR}$ and $CTRL$ on preceding page).

Two operating modes are possible for controlling the transfer of data from the input register to the DAC register, the automatic transfer mode and the strobed transfer mode.

AUTOMATIC TRANSFER MODE

This is the simplest and fastest method of transferring data to the DAC register. It is facilitated by connecting $\overline{LDAC}$ to either $CSMSB$, as shown in Figure 10, or $CSLSB$.

Figure 4 shows the timing diagram for automatic transfer of 8 + 4-bit data to the DAC register. The first write cycle loads the first byte of data to the input register. The second write cycle loads the second byte of data to the input register and automatically transfers both bytes to the DAC register.

Updating a single byte (High or Low) in the DAC register can be achieved in one write cycle using the automatic transfer mode.

Figure 4. Automatic Transfer Mode

STROBED TRANSFER MODE

Figure 5 shows the timing diagram for the strobed transfer of 8 + 4-bit data to the DAC register. Three write cycles are required for this transfer mode. The first two write cycles sequentially load bytes 1 and 2 into the input register. The third write cycle transfers data from the input register to the DAC register.

The strobed transfer mode allows the DAC registers of several AD7548's to be updated simultaneously, as shown in Figure 13, by means of a master strobe signal connected to the $\overline{LDAC}$ of each device.

A single byte of data (High or Low) can be transferred to the DAC register in two write cycles using the strobed transfer mode.

Figure 5. Strobed Transfer Mode

DATA OVERRIDE

The contents of the DAC register can be overridden by pulling $DF/\overline{DOR}$ (pin 5) LOW. The $CTRL$ (pin 6) input then determines whether the DAC register data is overridden by all 0s ($CTRL$ LOW) or all 1s ($CTRL$ HIGH). This feature allows the user to calibrate the AD7548 in-circuits such as Figure 6 without calling on the microprocessor to load calibration data.

Applying the AD7548

UNIPOLAR BINARY OPERATION (2-QUADRANT MULTIPLICATION)

Figure 6 shows the analog circuit connections required for unipolar binary operation. With a dc input voltage or current (positive or negative polarity) applied at pin 19, the circuit is a unipolar D/A converter. With an ac input voltage the circuit provides 2-quadrant multiplication (digitally controlled attenuation).

Table I shows the code relationship for the circuit of Figure 6. For full scale trimming the DAC register is loaded with 1111 1111 1111. This is most easily accomplished by using the data override function. R1 is then adjusted for $V_{OUT} = -V_{IN}$ (4095/4096). Alternatively full scale can be adjusted by omitting R1 and trimming the reference voltage magnitude.

Capacitor C1 provides phase compensation and helps prevent overshoot and ringing when using high speed op amps.

Figure 6. Unipolar Binary Operation

Binary Number in DAC Register		Analog Output, V_{OUT}
MSB	LSB	
1111	1111 1111	$-V_{IN} \left(\frac{4095}{4096} \right)$
1000	0000 0000	$-V_{IN} \left(\frac{2048}{4096} \right) = -1/2 V_{IN}$
0000	0000 0001	$-V_{IN} \left(\frac{1}{4096} \right)$
0000	0000 0000	0V

Table I. Unipolar Binary Code Table for Circuit of Figure 6

BIPOLAR OPERATION (4-QUADRANT MULTIPLICATION)

Figure 7 and Table II illustrate the recommended circuit and code relationship for bipolar operation. The circuit uses offset binary input coding. However, 2's complement coding can be accommodated if the MSB is inverted (done in software) before data is loaded into the DAC.

With the DAC register loaded to 1000 0000 0000, adjust R1 for $V_{OUT} = 0V$ (alternatively one can omit R1 and R2 and adjust the ratio of R3 and R4 for $V_{OUT} = 0V$). Full scale trimming can be accomplished by adjusting the amplitude of V_{IN} or by varying the value of R5.

R3, R4 and R5 must be selected to match within 0.01% and they should be the same type of resistor (preferably metal film) so that their temperature coefficients match. Mismatch of R3 to R4 causes both offset and full scale error. Mismatch of R5 to R4 and R3 causes full scale error.

Figure 7. Bipolar Operation (Offset Binary Coding)

Binary Number in DAC Register		Analog Output, V_{OUT}
MSB	LSB	
1111	1111 1111	$+V_{IN} \left(\frac{2047}{2048} \right)$
1000	0000 0001	$+V_{IN} \left(\frac{1}{2048} \right)$
1000	0000 0000	0V

0000	0000 0000	$-V_{IN} \left(\frac{2048}{2048} \right)$

Table II. Bipolar Code Table for Offset Binary Circuit of Figure 7

SINGLE SUPPLY OPERATION

Figure 8 shows the AD7548 connected in a voltage switching mode. The input voltage is connected to I_{OUT} . The D/A converter output voltage is taken from the V_{REF} pin and has a constant impedance equal to R . R_{FB} is not used in this circuit. The input voltage V_{IN} must always be positive with respect to AGND in order to prevent an internal diode from turning on. To maintain linearity the input voltage should remain within 2.5V of AGND with V_{DD} from +12V to +15V.

The output voltage V_{OUT} of Figure 8 is expressed as

$$V_{OUT} = (V_{IN}) (D) \left(\frac{R_1 + R_2}{R_1} \right)$$

Where D is a fractional representation of the digital input word ($0 \leq D \leq 4095/4096$).

Figure 8. Single Supply Operation Using Voltage Switching Mode

APPLICATION HINTS

Output Offset: CMOS D/A converters in circuits such as Figures 6 and 7 exhibit a code dependent output resistance which in turn cause a code dependent amplifier noise gain. The effect is a code dependent differential nonlinearity term at the amplifier output which, depends on V_{OS} where V_{OS} is the amplifier input offset voltage. To maintain monotonic operation it is recommended that V_{OS} be no greater than $(25 \times 10^{-6})(V_{REF})$ over the temperature range of operation. Suitable op amps are AD517L and AD544L. The AD517L is best suited for fixed reference applications with low bandwidth requirements: it has extremely low offset ($50\mu V$) and in most applications will not require an offset trim. The AD544L has a much wider bandwidth and higher slew rate and is recommended for multiplying and other applications requiring fast settling. An offset trim on the AD544L may be necessary in some circuits.

General Ground Management: AC or transient voltages between AGND and DGND can cause noise injection into the analog output. The simplest method of ensuring that voltages at AGND and DGND are equal is to tie AGND and DGND together at

the AD7548. In more complex systems where the AGND and DGND intertie is on the backplane, it is recommended that two diodes be connected in inverse parallel between the AD7548 AGND and DGND pins (1N914 or equivalent).

Temperature Coefficients: The gain temperature coefficient of the AD7548 has a maximum value of $5\text{ppm}/^\circ\text{C}$ and typical value of $2\text{ppm}/^\circ\text{C}$. This corresponds to worst case gain shifts of 2LSBs and 0.8LSBs respectively over a 100°C temperature range. When trim resistors R_1 and R_2 are used to adjust full scale range, the temperature coefficient of R_1 and R_2 should also be taken into account. The reader is referred to Analog Devices Application Note "Gain Error and Gain Temperature Coefficient of CMOS Multiplying DACs", Publication Number E630-10-6/81.

High Frequency Considerations: AD7548 output capacitance works in conjunction with the amplifier feedback resistance to add a pole to the open loop response. This can cause ringing or oscillation. Stability can be restored by adding a phase compensation capacitor in parallel with the feedback resistor.

Feedthrough: The dynamic performance of the AD7548 will depend upon the gain and phase stability of the output amplifier, together with the optimum choice of PC board layout and decoupling components. A suggested printed circuit layout for Figure 6 is shown in Figure 9 which minimizes feedthrough from V_{REF} to the output in multiplying applications.

Figure 9. Suggested Layout for AD7548 and Op Amp

For additional information on multiplying DACs refer to "Application Guide to CMOS Multiplying D/A Converters", Publication Number G479-15-8/78, available from Analog Devices.

AD7548 - MC6800 INTERFACE

Figure 1 is a block diagram showing the connection between an MC6800 microprocessor and an AD7548* DAC. The MC6800's address bus (A0-A15) is connected to the DAC's address bus. The MC6800's R/W control signal is connected to the DAC's EN pin. The MC6800's VMA signal is connected to the DAC's EN pin. The MC6800's A0 signal is connected to the DAC's CSLSB pin. The MC6800's A1 signal is connected to the DAC's CSMSB pin. The MC6800's A2 signal is connected to the DAC's LDAC pin. The MC6800's A3-A7 signals are connected to the DAC's DB0-DB7 data bus. The MC6800's D0-D7 data bus is connected to the DAC's data bus. The DAC's VDD pin is connected to the positive supply voltage.

REV. A

AD7548 – MC6809 INTERFACE

The AD7548 can be interfaced to the MC6809 microprocessor as shown in Figure 12 for automatic transfer of 8 + 4-bit data. Similar to the 8085A instructions LHL and SHLD, the 6809 has two instructions to fetch and store 12-bit (16-bit) data to the AD7548, LDD and STD. However, in the 6809, the high byte of data is moved first, then the low byte (this is the opposite of the 8085A). This means that if the 12-bit data is assumed to reside at addresses XXY and XXY + 1 then XXY must contain the high byte. It also means that the address decoding logic of Figure 11 must be slightly changed so that the even-order

AD7548 address, PPQQ from before, selects the CSMSB input to load the high byte first. In this automatic transfer configuration LDAC is tied to the CSLSB input. The AD7548 analog output can thus be updated using only two instructions as follows:

```
LDD    $XXYY
STD    $PPQQ
```

The strobed transfer configuration is shown in Figure 13 with a dedicated decoder output assigned to each chip select input. The common LDAC signal allows simultaneous update of both AD7548 DAC registers.

AD7548 – 6502 INTERFACE

Figure 14 shows a typical AD7548 to 6502 microprocessor interface configured for automatic transfer of right-justified data. As a programming example, Figure 15 shows a flow chart for producing a 12-bit (4095-step-max) voltage ramp under 6502 control. Index registers X and Y of the 6502 form a 12-bit counter with the X-register holding the low byte of data and the Y-register the high byte. Table V shows the program listing. The X-register is compared with FF_H and the Y-register with 10_H to determine when the ramp voltage has reached its maximum value (FFF_H). By changing the comparison data in the program the maximum ramp output voltage can be varied from levels corresponding to FFF_H down to 000_H. In the program listing of Table V the AD7548 has been assigned contiguous addresses 0400 (low byte) and 0401 (high byte and DAC register).

AD7548 – Z80 INTERFACE

Figure 16 shows a typical AD7548 to Z80 microprocessor interface configured for automatic transfer of right-justified data. Similar to the 8085A and 6809 cases, 16-bit load instructions are available in the Z80 which can fetch and load 12-bit data to the AD7548. Since the low byte of data is moved first and assuming the 12-bit data resides at addresses XXYX and XXYX + 1, address XXYX must contain the low byte. As before, addresses PPQQ and PPQQ + 1 select the AD7548 CSLSB and CSMSB/LDAC control inputs respectively. Choosing the Z80 register pair BC to hold the 12-bit data, the two instructions required to update the AD7548 analog output are as follows:

```
LD BC, (XXYY)
LD (PPQQ), BC
```
