

BGS12P2L6

SPDT general purpose switch for high power applications

Features

- High linearity up to 37 dBm input power
- Low insertion loss and high port to port isolation up to 6 GHz
- Low current consumption
- On-chip control logic
- Ultra low profile leadless plastic package
- RoHS and WEEE compliant package

Potential Applications

The BGS12P2L6 is a general purpose RF MOS power switch, designed to cover a broad range of high power applications from 0.05 to 6 GHz, mainly in the transmit path of GSM, WCDMA and LTE mobile phones.

Product Validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

BGS12P2L6

SPDT general purpose switch for high power applications

Features

1 Features

- RF CMOS SPDT antenna switch with power handling capability of up to 37 dBm
- Suitable for multi-mode LTE and WCDMA applications
- Low insertion loss and harmonics generation
- 0.05 to 6 GHz coverage
- High port-to-port isolation
- No blocking capacitors required if no DC applied on RF lines
- On-chip control logic
- Leadless and halogen free package TSLP-6-4 with lateral size of 0.7 mm x 1.1 mm and thickness of 0.31 mm
- No power supply decoupling required
- High EMI robustness
- RoHS and WEEE compliant package

Description

The BGS12P2L6 is a general purpose RF MOS power switch, designed to cover a broad range of high power applications from 0.05 to 6 GHz, mainly in the transmit path of GSM, WCDMA and LTE mobile phones. The chip integrates on-chip CMOS logic driven by a simple, single-pin CMOS or TTL compatible control input signal. Unlike GaAs technology, external DC blocking capacitors at the RF ports are only required if DC voltage is applied externally. The BGS12P2L6 RF switch is manufactured in Infineon's patented MOS technology, offering the performance of GaAs with the economy and integration of conventional CMOS including the inherent higher ESD robustness. The device has a very small size of only 0.7 x 1.1 mm² and a maximum height of 0.31 mm.

¹⁾ There is also a DC connection between switched paths. The DC voltage at RF ports V_{RFDC} has to be 0 V.

²⁾ Field-Induced Charged-Device Model ANSI/ESDA/JEDEC JS-002. Simulates charging/discharging events that occur in production equipment and processes. Potential for CDM ESD events occurs whenever there is metal-to-metal contact in manufacturing.

³⁾ Human Body Model ANSI/ESDA/JEDEC JS-001 ($R = 1.5\text{ k}\Omega$, $C = 100\text{ pF}$).

⁴⁾ IEC 61000-4-2 ($R = 330\text{ }\Omega$, $C = 150\text{ pF}$), contact discharge.

Warning: Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit. Exposure to conditions at or below absolute maximum rating but above the specified maximum operation conditions may affect device reliability and life time. Functionality of the device might not be given under these conditions.
