Integrated Power Module for Small Appliance Motor Drive Applications

Description

IRSM505-055 and IRSM515-055 are 3-phase Integrated Power Modules (IPM) designed for advanced appliance motor drive applications such as energy efficient fans and pumps. These advanced IPMs offers a combination of low $R_{DS(on)}$ Trench FREDFET technology and the industry benchmark half-bridge high voltage, rugged driver in a familiar package. The modules are optimized for low EMI characteristics.

IRSM505-055 includes temperature feedback while IRSM515-055 does not.

Features

- 500V 3-phase inverter including high voltage gate drivers
- Integrated bootstrap functionality
- Low 1.7Ω (max, 25°C) $R_{DS(on)}$ Trench FREDFET
- Under-voltage lockout for all channels
- Matched propagation delay for all channels
- Temperature feedback via NTC (IRSM505-055 only)
- Optimized dV/dt for loss and EMI trade offs
- Open-source for single and leg-shunt current sensing
- 3.3V logic compatible & advanced input filter
- Driver tolerant to negative transient voltage (-Vs)
- Isolation 1900V_{RMS}, 1min
- RoHS Compliant
- Certified by UL - File Number E252584

Figures 5-7 show the typical current capability for this module at specified conditions. In all tests, the application board – the IRMCS1071-1-D reference board – was placed in a box to prevent cooling from ambient airflow. Figure 5 is derived from using a heat sink that maintains T_C at 125°C. Figures 6-7 represent current capability for the module as used without any heat sink. ΔT_{JA} represents the difference in temperature between the junction of the high-side V-phase Mosfet and the ambient, measured 10cm above and 6cm away from the board. Ambient temperature kept within 28-29°C.

Figure 5: Maximum sinusoidal phase current vs PWM switching frequency with a heat sink. Space Vector Modulation, $V_+ = 320V$, $T_A = 28^\circ C$, $T_J = 150^\circ C$, $T_C = 125^\circ C$

Figure 6: Maximum sinusoidal phase current vs PWM switching frequency, no heat sink. Space Vector Modulation, $V_+ = 320V$, $T_A = 28^\circ C$, $T_J = 128^\circ C$

Figure 7: Maximum sinusoidal phase current vs PWM switching frequency, no heat sink. Space Vector Modulation, $V_{+}=320\text{V}$, $T_A=28^{\circ}\text{C}$, $T_J=98^{\circ}\text{C}$

The module contains an NTC – connected between COM and the V_{TH} pin – which can be used to monitor the temperature of the module. The NTC is effectively a resistor whose value decreases as the temperature rises. The NTC resistance can be calculated at any temperature as follows:

$$R_{TH} = R_{25} e^{\left[B \left(\frac{1}{T_{TH}} - \frac{1}{T_{25}} \right) \right]}, \text{ where } R_{25} \text{ is } 47\text{k}\Omega \text{ and } B \text{ is } 4050\text{K}$$

An external resistor network is connected to the NTC, the simplest of which is one resistor pulled up to V_{CC} as shown in Figure 3. The V_{TH} vs NTC temperature, T_{TH} curve for this configuration is shown in Figure 8 below. The min, typical and max curves result from the NTC having a $\pm 5\%$ tolerance on its resistance and $\pm 2\%$ tolerance on the B-parameter.

Figure 9 shows the thermistor temperature, T_{TH} plotted against the high-side V-phase junction temperature, T_J for a module without a heat sink. It is thus advisable to shut down the module when T_{TH} reaches 125°C .

Figure 8: V_{TH} vs T_{TH} with V_{TH} pin pulled up to V_{CC} with a 7.50kΩ (1%, 100ppm) resistor. A 15V, 1% variation in V_{CC} is assumed.

Figure 9: T_{TH} vs T_J for a module without a heat sink. V_{CC}=15.4V, R=7.50kΩ
