

M21328 HD/SD and 2xHD-SDI Cable Driver

The M21328 is a high-speed, low-power, low-jitter cable drivers. It is designed to drive serial digital video data through 75Ω coaxial cable typically used in SMPTE and DVB-ASI video applications. The M21328 cable driver is optimized for performance from 143 Mbps up to 2970 Mbps. It has selectable slew rates for SD-SDI and HD-SDI applications.

The typical output rise/fall time of the M21328 is 100 ps for HD and 2xHD rates. It has a typical set slew rate of 600 ps at SD rates. The default output voltage swing is compliant with SMPTE 292M, 259M, 344M and 424M using a 750Ω ±1% resistor. The M21328 supports a maximum single ended output swing of 1600 mVp-p, when configured appropriately.

The M21328 device is packaged in a new high performance 4x4 mm MLF package to simplify the PCB and reduce package parasitics with resulting improvements in Output Return Loss (ORL). It is available in an RoHS compliant package, that is backwards compatible with standard JEDEC SnPb processes.

The M21328 is pin compatible with the GS2978. It will also fit the footprint of the GS1578/1578A, but with the added feature of an Output Disable control pin.

Applications

- Serial Routing Switchers,
- Production/Master Control Switchers
- Distribution Amplifiers
- Video Tape Recorders, ENG Edit decks, Cameras
- Broadcast video applications
- NLE's, MPEG Encoders/Decoders, format convertors etc.

Standards Compliance

- SMPTE 292M, 259M, 344M, 424M
- DVB-ASI

Features

- 2xHD, HD and SD operation
- 800 mVp-p single ended output swing (typical)
- 1600 mVp-p maximum single ended output swing
- SD/HD Slew Rate control
- 3.3V Supply
- Low P_{DISS} (144 mW @ 3.3V)
- Extended temp. range: -10 to 85°C
- RoHS package
- Output disable

NOTES:

- Entire table specified at recommended operating condition with 400 mV_{p-p} differential input—see [Table 1-2](#).
- Specification verified at 800 mVpp output with 1m cable on MSPD test board. System results may vary.
- Rated at nominal SMPTE 800 mV output swing level (using a 750Ω ±1% resistor at RSET).
- Output stage is an open collector differential pair, actual swing dependant on IC supply voltage and external termination voltage.
- Into 75Ω back termination and 75Ω load and appropriate external termination voltage, see [Table 2-1](#), [Figure 2-3](#).
- Duty Cycle Distortion (DCD) is defined as the difference in the intrinsic jitter at the 50% voltage level and the intrinsic jitter at the rising/falling edge crossing point. If the rising/falling edge crossing point is at the 50% voltage level, then DCD = 0.
- Measured under DC conditions that simulate AC coupling, V_T = 3.3V.
- Measured using a “1010” data pattern.

1.5 Package Specification

1.5.1 Mechanical Description

1.5.1.1 Package Information

The M21328 is available in a 16 pin 4x4mm MLF IC package. The pin out is shown in [Figure 1-2](#) and the package drawing in [Figure 1-3](#).

1.6 Manufactureability

The values shown in this section may change; however, these are standard requirements.

1.6.1 Electrostatic Discharge

Tested per JESD22-A114. This device passes 2000V of ESD Human Body Model (HBM) testing.

Tested per JESD22-C101. This device passes 500V of ESD Charged Device Model (CDM) testing.

Tested per EIA/JESD78. This device passes 150mA of trigger current at 85°C during Latchup testing.

1.6.2 Peak Reflow Temperature

M21328G (RoHS compliant package): Peak reflow temperature is 260°C per JEDEC standards.

1.7 Design Considerations

See Digital Video Interfacing Application Note (212xx-APP-001-A) for guidance on the following:

- Component Placement and Layout
- Routing Considerations and Thermal Considerations

The M21328 consumes less power than legacy devices, therefore the M21328 will contribute less thermal energy resulting in a lower operating temperature.

2.0 Functional Description

2.1 Features

2.1.1 HD-SDI and SD-SDI Slew-rate Selection

The output slew rate of the M21328 is selectable to conform with the different SD-SDI, HD-SDI, and 2xHD specifications. With $\overline{\text{SD/HD}}$ = Low, rise/fall time is typically 100 ps. The slew rate will vary depending on the output matching network and connector used.

With $\overline{\text{SD/HD}}$ = High, for standard definition (143 to 540 Mbps) applications, the rise/fall time is typically 600 ps, which is compliant with SMPE 259M and SMPTE 344M.

2.1.2 Output Amplitude Adjustment

A resistor connected to **RSET** pin is used to set the single ended output amplitude swing.

For SMPTE compliance, an external $750\Omega \pm 1\%$ resistor at **RSET** to **A_{VDD}** is recommended for a swing level of 800mV within a tolerance that is less than $\pm 10\%$ which meets SMPTE requirements. The output amplitude can also be adjusted to range from 500 to 1600 mVpp single ended using the following formula:

$$\text{Output Swing} = (600/\text{RSET}) [\text{RSET in k}\Omega] \text{ (in mVpp, Single Ended)}$$

The actual swing is set as a function of the IC supply voltage, the external termination voltage and the limitations are shown in [Table 2-1](#). In applications where a lossy matching or splitting networks are used, the M21328 offers additional gain of up to 1600 mVpp swings, so the output after the lossy network can be SMPTE compliant.

Table 2-1. Output Swing vs. Supply and Termination Voltage

A_{VDD} (V)	A_{VDDTERM} (V)	Maximum Swing (Single-ended mVp-p)	Minimum Swing (Single-ended mVp-p)
3.3V	3.3V	1200 mV	500 mV
3.3V	5.0V	1600 mV	500 mV

2.2 Pin Definitions

2.2.1 High-speed Inputs

The M21328 is designed to be operated with input signals as low as 100 mV or up to 2000 mV differential peak to peak. The M21328 uses external 50Ω input termination resistors to match 100Ω differential impedance transmission lines for improved system level performance. The M21328 recommended input circuits are shown in [Figure 2-1](#) and [Figure 2-2](#).

Note that AC coupling is not required when the M21328 is driven by Mindspeed Broadcast video devices.

2.2.3 M21328 Pin List

Table 2-2. Interface Pins

Pin Name	Pin #	Function	Default	Type
RSET	4	Input control signal for setting the single-ended output swing amplitude. Higher output swing levels or reduced variations with a $\pm 1\%$ tolerance external resistor. For 800mVp-p single-ended, a $750\Omega \pm 1\%$ resistor to AV_{DD} is recommended.	—	Analog Input

Table 2-4. High-speed Signal Pins

Pin Name	Pin #	Function	Default	Type
$SDI/\overline{SDI}$	1, 2	Non-inverting and Inverting serial externally terminated inputs.	—	I—High-speed
$SDO/\overline{SDO}$	12, 11	Non-inverting and inverting serial unterminated data outputs to coaxial cable.	—	O—High-speed

Table 2-5. Control Pins

Pin Name	Pin #	Function	Default	Type
$SD/\overline{HD}$	10	Input control signal to change the output slew rate. $SD/\overline{HD}$ = High: Slow output slew rate for SD-SDI rate (143–540 Mbps). $SD/\overline{HD}$ = Low: Fast output slew rate for HD and 2xHD-SDI rate.	Pull-up	I—CMOS
$\overline{DISABLE}$	6	A low disables the $SDO/\overline{SDO}$ outputs. A high enables the $SDO/\overline{SDO}$ outputs.	Pull-up	I—CMOS

NOTES:

Internal pull-ups/pull-downs are 100 k Ω .
