

## 0.14 GHz to 1.5 GHz QUADRATURE MODULATOR

### FEATURES

- P1dB of 7 dBm
- –156 dBm/Hz Noise Floor
- –150 dBm/Hz Noise at  $P_{OUT} = 0$  dBm
- Typical Unadjusted Carrier Suppression > 35 dBc at 1 GHz
- Typical Unadjusted Sideband Suppression > 40 dBc at 1 GHz
- Differential or Single-Ended I, Q Inputs
- Convenient Single-Ended LO Input
- Silicon Germanium Technology

### APPLICATIONS

- Cellular Base Transceiver Station Transmit Channel
- IF Sampling Applications
- TDMA: GSM, IS-136, EDGE/UWC-136
- CDMA: IS-95, UMTS, CDMA2000
- Wireless Local Loop
- Wireless LAN IEEE 802.11
- LMDS, MMDS
- Wideband Baseband Transceivers

### DESCRIPTION

The TRF3701 is an ultralow-noise direct quadrature modulator that is capable of converting complex input signals from baseband or IF directly up to RF. An internal analog combiner sums the real and imaginary components of the RF outputs. This combined output can feed the RF preamp directly at frequencies of up to 1.5 GHz. The modulator is implemented as a double-balanced mixer. An internal local oscillator (LO) phase splitter accommodates a single-ended LO input, eliminating the need for a costly external balun.

P0003-01

### AVAILABLE OPTIONS

$T_A$	4-mm × 4-mm 16-Pin RHC (QFN) Package
–40°C to 85°C	TRF3701IRHC
	TRF3701IRHCR (Tape and Reel)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### FUNCTIONAL BLOCK DIAGRAM

B0002-01

**Table 1. TERMINAL FUNCTIONS**

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
GND	1, 2, 3, 5, 9, 11, 12		Ground
IREF	15	I	In-phase (I) reference voltage/differential input
IVIN	14	I	In-phase (I) signal input
LO	4	I	Local oscillator input
PWD	7	I	Power down
QREF	16	I	Quadrature (Q) reference voltage/differential input
QVIN	13	I	Quadrature (Q) signal input
RFOUT	8	O	RF output
VCC	6, 10		Supply voltage

## ABSOLUTE MAXIMUM RATINGS

 over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

V <sub>CC</sub>	Supply voltage range	–0.5 V to 6 V
	LO input power level	10 dBm
	Baseband input voltage level (single-ended)	3 V <sub>p-p</sub>
T <sub>A</sub>	Operating free-air temperature range	–40°C to 85°C
	Lead temperature for 10 seconds	260°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Measured with respect to ground

## RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
<b>Supplies and References</b>					
V <sub>CC</sub>	Analog supply voltage	4.5	5	5.5	V
	VCM (IVIN, QVIN, IREF, QREF input common-mode dc voltage)		3.7		V
<b>Local Oscillator Input (LO)</b>					
	Input frequency	140		1500	MHz
	Power level (measured into 50 Ω)	–6	0	6	dBm
<b>Signal Inputs (IVIN, QVIN)</b>					
	Input bandwidth		700		MHz
PWD Operation	V <sub>IL</sub>		0	1.2	V
	V <sub>IH</sub>	3.7	5		

## ELECTRICAL CHARACTERISTICS

 Over recommended operating conditions, V<sub>CC</sub> = 5 V, VCM = 3.7 V, f<sub>LO</sub> = 942.5 MHz at 0 dBm, T<sub>A</sub> = 25°C (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Power Supply</b>

**RF OUTPUT PERFORMANCE (942.5 MHz)**

Over recommended operating conditions,  $V_{CC} = 5\text{ V}$ ,  $V_{CM} = 3.7\text{ V}$ ,  $f_{LO} = 942.5\text{ MHz}$  at 0 dBm,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)<sup>(1)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Single and Two-Tone Specifications</b>						
Output power			-3.5	-1		dBm
Second baseband harmonic (USB or LSB) <sup>(3)</sup>	I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$			-50	-45	dBc
Third baseband harmonic (USB or LSB) <sup>(3)</sup>				-61	-55	dBc
IMD <sub>3</sub>		I, Q <sup>(2)</sup> = 1 Vp-p (two-tone signal, $f_{BB1} = 928\text{ kHz}$ , $f_{BB2} = 992\text{ kHz}$ )		-55	-45	dBc
P1dB (output compression point)				6.5		dBm
NSD Noise spectral density		I, Q <sup>(4)</sup> = $V_{CM} = 3.7\text{ VDC}$		-156		dBm/Hz
		6-MHz offset from carrier, $P_{out} = -10\text{ dBm}$ , over temperature		-153	-151 <sup>(5)</sup>	
		6-MHz offset from carrier, $P_{out} = -5\text{ dBm}$ , over temperature		-152	-150 <sup>(5)</sup>	
		6-MHz offset from carrier, $P_{out} = 0\text{ dBm}$ , over temperature		-150	-148 <sup>(5)</sup>	
RFOUT pin impedance			26 + j3			$\Omega$
Carrier suppression		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , unadjusted	30	35		dBc
		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , optimized		55		
		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , over temperature		35		
Sideband suppression		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , unadjusted	37	50		dBc
		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , optimized		55		
		I, Q <sup>(2)</sup> = 1 Vp-p, $f_{BB} = 928\text{ kHz}$ , over temperature		38		

(1) Baseband inputs are differential; equivalent performance is attained by using single-ended drive.

(2) I, Q = 1 Vp-p implies that the magnitude of the signal at each input pin IVIN, IREF, QVIN, QREF is equal to 500 mVp-p.

(3) USB = upper sideband. LSB = lower sideband.

(4) All input pins tied to VCM

(5) Maximum noise values are assured by statistical characterization only, not production testing. The values specified are over the entire temperature range,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ .

## RF OUTPUT PERFORMANCE (340 MHz)

Over recommended operating conditions,  $V_{CC} = 5\text{ V}$ ,  $V_{CM} = 3.7\text{ V}$ ,  $f_{LO} = 340\text{ MHz}$  at 0 dBm,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)<sup>(1)</sup>

(3) USB = upper sideband. LSB = lower sideband.

## DEFINITIONS OF SELECTED SPECIFICATIONS

### Unadjusted Carrier Suppression

This specification measures the amount by which the local oscillator component is attenuated in the output spectrum of the modulator relative to the carrier. It is assumed that the baseband inputs delivered to the pins of the TRF3701 are perfectly matched to have the same dc offset (VCM). This includes all four baseband inputs: IVIN, QVIN, IREF and QREF. Unadjusted carrier suppression is measured in dBc.

### Adjusted (Optimized) Carrier Suppression

This differs from the unadjusted suppression number in that the dc offsets of the baseband inputs are iteratively adjusted around their theoretical value of VCM in order to yield the maximum suppression of the LO component in the output spectrum. Adjusted carrier suppression is measured in dBc.

### Unadjusted Sideband Suppression

This specification measures the amount by which the unwanted sideband of the input signal is attenuated in the output of the modulator, relative to the wanted sideband. It is assumed that the baseband inputs delivered to the modulator input pins are perfectly matched in amplitude and are exactly 90° out of phase. Unadjusted sideband suppression is measured in dBc.

### Adjusted (Optimized) Sideband Suppression

This differs from the unadjusted sideband suppression in that the baseband inputs are iteratively adjusted around their theoretical values to maximize the amount of sideband suppression. Adjusted sideband suppression is measured in dBc.

### Suppressions Over Temperature

This specification assumes that the user has gone through the optimization process for the suppression in question, and set the optimal settings for the I, Q inputs at room temperature. This specification then measures the suppression when temperature conditions change after the initial calibration is done.

**TYPICAL CHARACTERISTICS**

For all the performance plots in this section, the following conditions were used, unless otherwise noted:  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{CM} = 3.7\text{ V}$ ,  $f_{LO} = 942.5\text{ MHz}$  at  $P_{LO} = 0\text{ dBm}$ , I and Q inputs driven differentially at a frequency of  $50\text{ kHz}$  for an output power level  $P_{out} = 0\text{ dBm}$ . In the case of optimized suppressions, the point of optimization is noted and is always at nominal conditions and room temperature. A level of  $>50\text{ dBc}$  is assumed to be optimized.

### THEORY OF OPERATION

The TRF3701 employs a double-balanced mixer architecture in implementing the direct I, Q upconversion. The I, Q inputs can be driven single-endedly or differentially, with comparable performance in both cases. The common mode level (VCM) of the four inputs (IVIN, IREF, QVIN, QREF) is typically set to 3.7 V and needs to be driven externally. These inputs go through a set of differential amplifiers and through a V-I converter feed the double-balanced mixers. The AC-coupled LO input to the device goes through a phase splitter to provide the in-phase and quadrature signals that in turn drive the mixers. The outputs of the mixers are then summed, converted to single-ended signals, and amplified before they are fed to the output port RFOUT. The output of the TRF3701 is ac-coupled and can drive 50-Ω loads.

### EQUIVALENT CIRCUITS

## APPLICATION INFORMATION

### DRIVING THE I, Q INPUTS

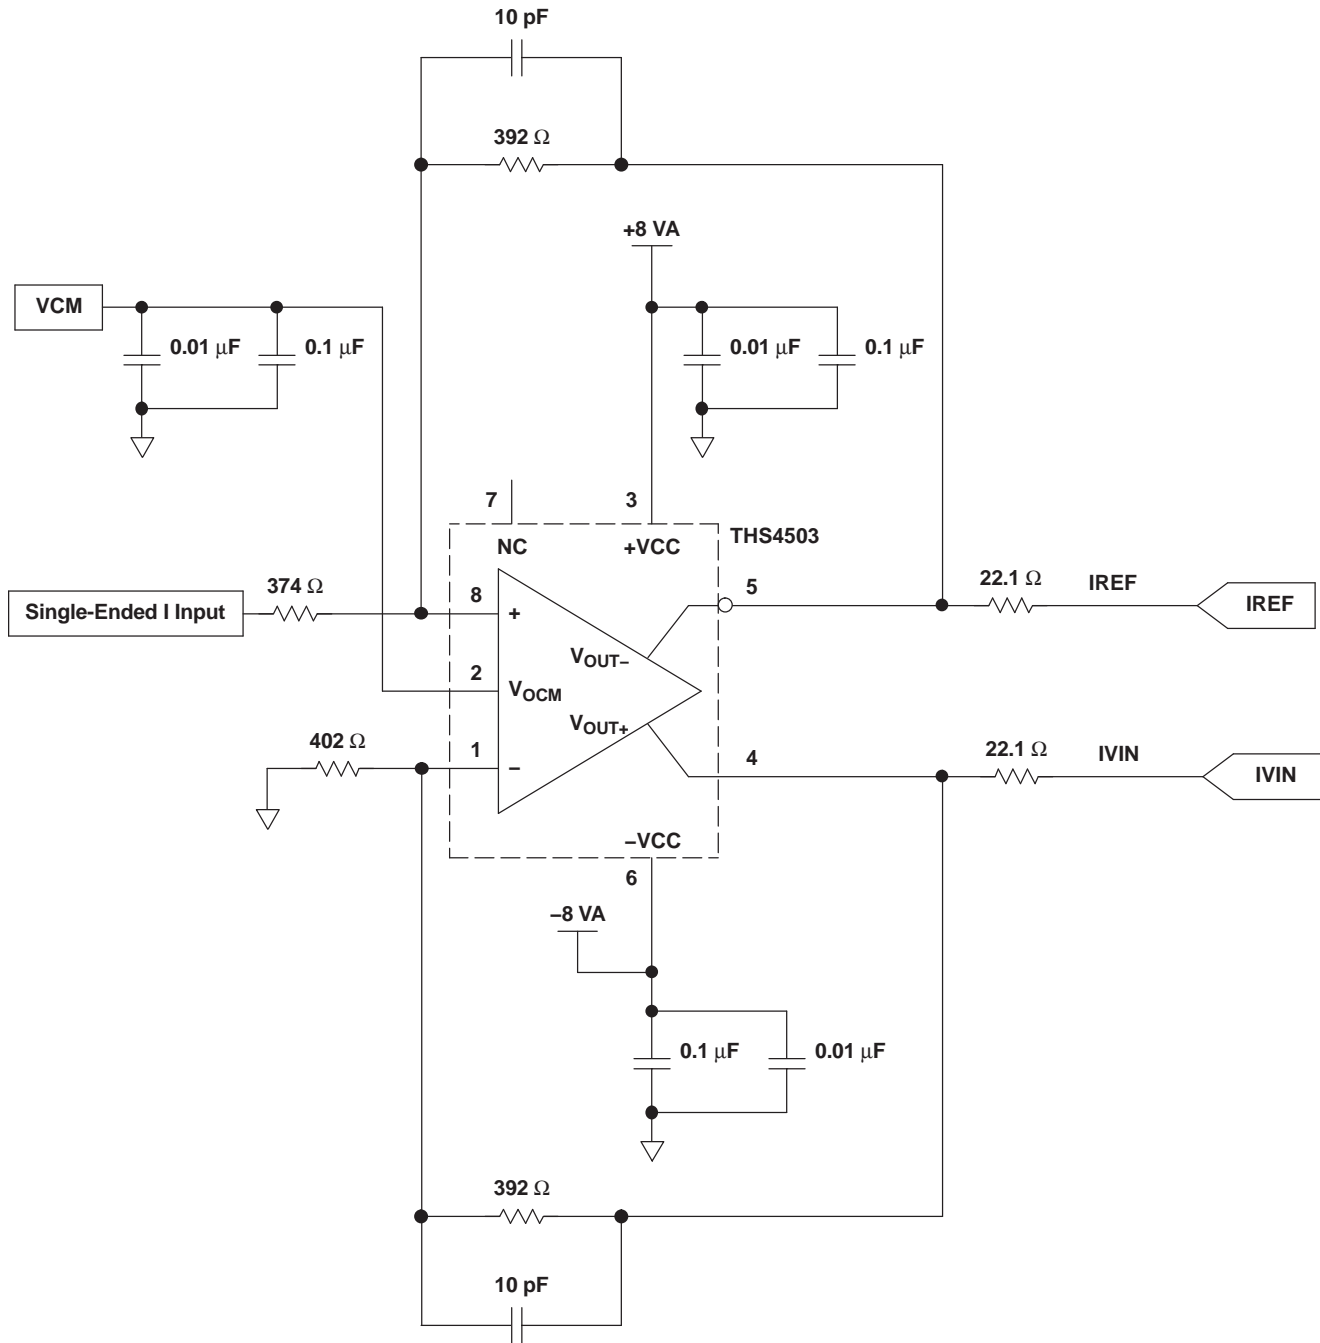

There are several ways to drive the four baseband inputs of the TRF3701 to the required amplitude and dc offset. The optimal configuration depends on the end application requirements and the signal levels desired by the designer.

The TRF3701 is by design a differential part, meaning that ideally the user should provide fully complementary signals. However, similar performance in every respect can be achieved if the user only has single-ended signals available. In this case, the IREF and QREF pins just need to have the VCM dc offset applied.

#### Implementing a Single-to-Differential Conversion for the I, Q inputs

In case differential I, Q signals are desired but not available, the THS4503 family of wideband, low-distortion, fully differential amplifiers can be used to provide a convenient way of performing this conversion. Even if differential signals are available, the THS4503 can provide gain in case a higher voltage swing is required. Besides featuring high bandwidth and high linearity, the THS4503 also provides a convenient way of applying the VCM to all four inputs to the modulator through the VOCM pin (pin 2). The user can further adjust the dc levels for optimum carrier suppression by injecting extra dc at the inputs to the operational amplifier, or by individually adding it to the four outputs. [Figure 55](#) shows a typical implementation of the THS4503 as a driver for the TRF3701. Gain can be easily incorporated in the loop by adjusting the feedback resistors appropriately. For more details, see the THS4503 data sheet at [www.ti.com](http://www.ti.com).

APPLICATION INFORMATION (continued)

S0005-02

Figure 55. Using the THS4503 to Condition the Baseband Inputs to the TRF3701 (I Channel Shown)

DRIVING THE LOCAL OSCILLATOR INPUT

The LO pin is internally terminated to 50 Ω, thus enabling easy interface to the LO source without the need for external impedance matching. The power level of the LO signal should be in the range of -6 to 6 dBm. For characterization purposes, a power level of 0 dBm was chosen. An ideal way of driving the LO input of the TRF3701 is by using the TRF3750, an ultralow-phase-noise integer-N PLL from Texas Instruments. Combining

**APPLICATION INFORMATION (continued)**

This section illustrates the use of the DAC5686, which offers a unique set of features that make interfacing to the TRF3701 easy and convenient. The DAC5686 is a 16-bit, 500 MSPS, 2x–16x interpolating dual-channel DAC, and it features I, Q adjustments for optimal interface to the TRF3701. User-selectable, 11-bit offset and 12-bit gain adjustments can optimize the carrier and sideband suppression of the modulator, resulting in enhanced performance and relaxed filtering requirements at RF. The preferred mode of operation of the DAC5686 for direct interface with the TRF3701 at baseband is the dual-DAC mode. The user also has the flexibility of selecting any one of the four possible complex spectral bands to be fed into the TRF3701. For details on the available modes and programming, see the DAC5686 data sheet available at [www.ti.com](http://www.ti.com).

Figure 57 shows the DAC5686 in dual-DAC mode, which is best-suited for zero-IF interface to the TRF3701. In this mode, a seamless, passive interface between the DAC output and the input to the modulator is used, so that no extra components are needed between the two devices. The optimum dc offset level for the inputs to the TRF3701 (VCM) is approximately 3.7 V. The output of the DAC should be centered around 3.3 V or less (depending on signal swing), in order to ensure that its output compliance limits are not exceeded. The resistive network shown in Figure 57 allows for this dc offset transition while still providing a dc path between the DAC output and the modulator. This ensures that the dc offset adjustments on the DAC5686 can still be applied to optimize the carrier suppression at the modulator output. The combination of the DAC5686 and the TRF3701 provides a unique signal-chain solution with state-of-the-art performance for wireless infrastructure applications.

S0010-01

**Figure 57. DAC5686 in Dual-DAC Mode with Quadrature Modulator**

**APPLICATION INFORMATION (continued)**

**TRF3701 Power Down (PWD) Pin Operation**

The power down pin (PWD) in the TRF3701 powers down the chip when 0V is applied to this pin. The TRF3701 is enabled when 5V is applied to the PWD pin. Figure 58 shows the output power as a function of time when the PWD pin is pulled down from 5V to 0V. Both the I/Q signals and the LO are present during the power down. Figure 59 shows the output power as a function of time when the PWD pin is pulled up from 0V to 5V. In both the power down and power up operation there is a smooth transition with no glitches in output power.

The device will not turn on till a voltage greater than 1.2V is applied at the PWD pin. In addition the device does not turn off till the PWD is pulled below 3.7V. This ensures that the device does not accidentally change state due to glitches on the PWD pin. The turn on time of the device is 120 ns and the turn off time is 20 ns.

**Figure 58. Output power as a Function of Time During a Power-Down Operation (PWD Pin goes from 5V to 0V)**

**APPLICATION INFORMATION (continued)**

Figure 59. Output Power as a Function of Time During a Power-Up Operation (PWD Pin goes from 0V to 5V)

**Optimizing Carrier and Sideband Suppression**

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RHC (S-PQFP-N16) (CUSTOM PACKAGE) PLASTIC QUAD FLATPACK

4204353/B 12/2004

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) Package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
