

AT93C56B/AT93C66B

Three-wire Serial EEPROM 2-Kbit (256 x 8 or 128 x 16) and 4-Kbit (512 x 8 or 256 x 16)

Features

- Low-Voltage Operation:
 - $V_{CC} = 1.7V$ to $5.5V$
- User-Selectable Internal Organization:
 - 2K: 256 x 8 or 128 x 16
 - 4K: 512 x 8 or 256 x 16
- Industrial Temperature Range: $-40^{\circ}C$ to $+85^{\circ}C$
- Three-Wire Serial Interface
- Sequential Read Operation
- 2 MHz Clock Rate (5V)
- Self-Timed Write Cycle within 5 ms Maximum
- High Reliability:
 - Endurance: 1,000,000 write cycles
 - Data retention: 100 years
- Green Package Options (Lead-free/Halide-free/RoHS compliant)
- Die Sale Options: Wafer Form

Packages

- 8-Lead SOIC, 8-Lead TSSOP, 8-Pad UDFN, 8-Pad XDFN and 8-Ball VFBGA

2. Pin Descriptions

The descriptions of the pins are listed below in the [Table 2-1](#).

Table 2-1. Pin Function Table

Name	8-Lead SOIC	8-Lead TSSOP	8-Pad UDFN ⁽¹⁾	8-Pad XDFN	8-Ball VFBGA	Function
CS	1	1	1	1	1	Chip Select
SK	2	2	2	2	2	Serial Data Clock
DI	3	3	3	3	3	Serial Data Input
DO	4	4	4	4	4	Serial Data Output
GND	5	5	5	5	5	Ground
ORG	6	6	6	6	6	Internal Organization
NC	7	7	7	7	7	No Connect
VCC	8	8	8	8	8	Device Power Supply

Note:

1. The exposed pad on this package can be connected to GND or left floating.

2.1 Chip Select (CS)

The Chip Select (CS) pin is used to control device selection. The AT93C56B/AT93C66B is selected when the CS pin is high. When the device is not selected, data will not be accepted via the Serial Data Input (DI) pin, and the Serial Output (DO) pin will remain in a high-impedance state.

2.2 Serial Data Clock (SK)

The Serial Data Clock (SK) pin is used to synchronize the communication between a master and the AT93C56B/AT93C66B. Instructions, addresses or data present on the Serial Data Input (DI) pin is latched in on the rising edge of SK, while output on the Serial Data Output (DO) pin is also clocked out on the rising edge of SK.

2.3 Serial Data Input (DI)

The Serial Data Input (DI) pin is used to transfer data into the device. It receives instructions, addresses and data. Data is latched on the rising edge of the Serial Data Clock (SK).

2.4 Serial Data Output (DO)

The Serial Data Output (DO) pin is used to transfer data out of the AT93C56B/AT93C66B. During a read sequence, data is shifted out on this pin after the rising edge of the Serial Data Clock (SK).

This pin also outputs the Ready/Busy status of the part if CS is brought high after being low for a minimum of t_{CS} and an erase or write operation has been initiated.

2.5 Ground (GND)

The ground reference for the power supply. The Ground (GND) pin should be connected to the system ground.

2.6 Internal Organization (ORG)

The Internal Organization (ORG) pin is used to select between the x16 or x8 memory organizations of the device. When the ORG pin is tied to V_{CC} , the x16 memory organization is selected. When the ORG pin is tied to V_{SS} , the x8 memory organization is selected.

If the ORG pin is left unconnected and the application does not load the input beyond the capability of the internal 1 M Ω pull-up resistor, then the x16 organization is selected.

2.7 Device Power Supply (V_{CC})

The Device Power Supply (V_{CC}) pin is used to supply the source voltage to the device. Operations at invalid V_{CC} voltages may produce spurious results and should not be attempted.

3. Description

The AT93C56B/AT93C66B provides 2,048/4,096 bits of Serial Electrically Erasable and Programmable Read-Only Memory (EEPROM) organized as 128/256 words of 16 bits each (when the ORG pin is connected to V_{CC}) and 256/512 words of 8 bits each (when the ORG pin is tied to ground). The device is optimized for use in many industrial and commercial applications where low-power and low-voltage operations are essential. The AT93C56B/AT93C66B is available in space-saving 8-lead SOIC, 8-lead TSSOP, 8-pad UDFN, 8-pad XDFN and 8-ball VFBGA packages. All packages operate from 1.7V to 5.5V.

The AT93C56B/AT93C66B is enabled through the Chip Select (CS) pin and accessed via a three-wire serial interface consisting of Data Input (DI), Data Output (DO), and Serial Data Clock (SK). Upon receiving a **READ** instruction at DI, the address is decoded, and the data is clocked out serially on the DO pin. The write cycle is completely self-timed, and no separate erase cycle is required before write. The write cycle is only enabled when the part is in the Erase/Write Enable state. When CS is brought high following the initiation of a write cycle, the DO pin outputs the Ready/Busy status of the part.

3.1 Block Diagram

Note: When the ORG pin is connected to V_{CC} , the x16 organization is selected. When it is connected to ground, the x8 organization is selected. If the ORG pin is left unconnected, and the application does not load the input beyond the capability of the 10 MΩ pull-up resistor, then the x16 organization is selected.

4. Electrical Characteristics

4.1 Absolute Maximum Ratings

Temperature under bias	-55°C to +125°C
Storage temperature	-65°C to +150°C
V _{CC}	6.25V
Voltage on any pin with respect to ground	-1.0V to +7.0V
DC output current	5.0 mA

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

4.2 DC and AC Operating Range

Table 4-1. DC and AC Operating Range

AT93C56B/AT93C66B		
Operating Temperature (Case)	Industrial Temperature Range	-40°C to +85°C
V _{CC} Power Supply	Low-Voltage Grade	1.7V to 5.5V

4.3 DC Characteristics

Table 4-2. DC Characteristics⁽¹⁾

Parameter	Symbol	Minimum	Typical	Maximum	Units	Test Conditions
Supply Voltage	V _{CC1}	1.7	—	5.5	V	
Supply Voltage	V _{CC2}	2.5	—	5.5	V	
Supply Voltage	V _{CC3}	4.5	—	5.5	V	
Supply Current	I _{CC1}	—	0.5	2.0	mA	V _{CC} = 5.0V, Read at 1 MHz
Supply Current	I _{CC2}	—	0.5	2.0	mA	V _{CC} = 5.0V, Write at 1 MHz
Standby Current (1.7V Option)	I _{SB1}	—	0.4	1.0	μA	V _{CC} = 1.7V, CS = 0V
Standby Current (2.5V Option)	I _{SB2}	—	6.0	10.0	μA	V _{CC} = 2.5V, CS = 0V
Standby Current (5.0V Option)	I _{SB3}	—	10.0	15.0	μA	V _{CC} = 5.0V, CS = 0V
Input Leakage Current	I _{IL}	—	0.1	3.0	μA	V _{IN} = 0 to V _{CC}
Output Leakage Current	I _{LO}	—	0.1	3.0	μA	V _{IN} = 0 to V _{CC}
Input Low-Voltage	V _{IL1}	-0.6	—	0.8	V	2.5V ≤ V _{CC} ≤ 5.5V (Note 2)

.....continued

Parameter	Symbol	Minimum	Typical	Maximum	Units	Test Conditions
Input High-Voltage	V_{IH1}	2.0	—	$V_{CC} + 1$	V	$2.5V \leq V_{CC} \leq 5.5V$ (Note 2)
Input Low-Voltage	V_{IL2}	-0.6	—	$V_{CC} \times 0.3$	V	$1.7V \leq V_{CC} \leq 2.5V$ (Note 2)
Input High-Voltage	V_{IH2}	$V_{CC} \times 0.7$	—	$V_{CC} + 1$	V	$1.7V \leq V_{CC} \leq 2.5V$ (Note 2)
Output Low-Voltage	V_{OL1}	—	—	0.4	V	$2.5V \leq V_{CC} \leq 5.5V$, $I_{OL} = 2.1$ mA
Output High-Voltage	V_{OH1}	2.4	—	—	V	$2.5V \leq V_{CC} \leq 5.5V$, $I_{OH} = -0.4$ mA
Output Low-Voltage	V_{OL2}	—	—	0.2	V	$1.7V \leq V_{CC} \leq 2.5V$, $I_{OL} = 0.15$ mA
Output High-Voltage	V_{OH2}	$V_{CC} - 0.2$	—	—	V	$1.7V \leq V_{CC} \leq 2.5V$, $I_{OH} = -100$ μ A

Note:

1. Applicable over recommended operating range from: $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = 1.7V$ to $5.5V$ (unless otherwise noted).
2. V_{IL} min and V_{IH} max are reference only and are not tested.

4.4 AC Characteristics

Table 4-3. AC Characteristics⁽¹⁾

Parameter	Symbol	Minimum	Typical	Maximum	Units	Test Conditions
Clock Frequency, SK	f_{SK}	0	—	2	MHz	$4.5V \leq V_{CC} \leq 5.5V$
		0	—	1	MHz	$2.5V \leq V_{CC} \leq 5.5V$

Minimum CS Low Time	t_{CS}	250	—	—	ns	$2.5V \leq V_{CC} \leq 5.5V$
		1000	—	—	ns	$1.7V \leq V_{CC} \leq 5.5V$
CS Setup Time	t_{CSS}	50	—	—	ns	$2.5V \leq V_{CC} \leq 5.5V$, Relative to SK
		200	—	—	ns	$1.7V \leq V_{CC} \leq 5.5V$, Relative to SK
DI Setup Time	t_{DIS}	100	—	—	ns	$2.5V \leq V_{CC} \leq 5.5V$, Relative to SK
		400	—	—	ns	$1.7V \leq V_{CC} \leq 5.5V$, Relative to SK
CS Hold Time	t_{CSH}	0	—	—	ns	Relative to SK

.....continued						
Parameter	Symbol	Minimum	Typical	Maximum	Units	Test Conditions
DI Hold Time	t_{DIH}	100	—	—	ns	$2.5V \leq V_{CC} \leq 5.5V$, Relative to SK
		400	—	—	ns	$1.7V \leq V_{CC} \leq 5.5V$, Relative to SK
Output Delay to 1	t_{PD1}	—	—	250	ns	$2.5V \leq V_{CC} \leq 5.5V$
		—	—	1000	ns	$1.7V \leq V_{CC} \leq 5.5V$
Output Delay to 0	t_{PD0}	—	—	250	ns	$2.5V \leq V_{CC} \leq 5.5V$
		—	—	1000	ns	$1.7V \leq V_{CC} \leq 5.5V$
CS to Status Valid	t_{SV}	—	—	250	ns	$2.5V \leq V_{CC} \leq 5.5V$
		—	—	1000	ns	$1.7V \leq V_{CC} \leq 5.5V$,
CS to DO in High-impedance	t_{DF}	—	—	150	ns	$2.5V \leq V_{CC} \leq 5.5V$, CS = V_{IL}
		—	—	400	ns	$1.7V \leq V_{CC} \leq 5.5V$, CS = V_{IL}
Write Cycle Time	t_{WP}	0.1	3	5	ms	$1.7V \leq V_{CC} \leq 5.5V$

Note:

- Applicable over recommended operating range from $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = \text{As Specified}$, $C_L = 1$ TTL Gate and 100 pF (unless otherwise noted).

4.5 Synchronous Data Timing

Figure 4-1. Synchronous Data Timing

**Note:**

- This is the minimum SK period.

4.6 Electrical Specifications

4.6.1 Power-Up Requirements and Reset Behavior

During a power-up sequence, the V_{CC} supplied to the AT93C56B/AT93C66B should monotonically rise from GND to the minimum V_{CC} level, as specified in Table 4-1, with a slew rate no faster than 0.1 V/ μ s.

4.6.1.1 Device Reset

To prevent inadvertent write operations or any other spurious events from occurring during a power-up sequence, the AT93C56B/AT93C66B includes a Power-on Reset (POR) circuit. Upon power-up, the device will not respond to any commands until the V_{CC} level crosses the internal voltage threshold (V_{POR}) that brings the device out of Reset and into Standby mode.

The system designer must ensure the instructions are not sent to the device until the V_{CC} supply has reached a stable value greater than or equal to the minimum V_{CC} level. Additionally, once the V_{CC} is greater than or equal to the minimum V_{CC} level, the bus master must wait at least t_{PUP} before sending the first command to the device. See Power-up Conditions⁽¹⁾ for the values associated with these power-up parameters.

Table 4-4. Power-up Conditions⁽¹⁾

Symbol	Parameter	Min.	Max.	Units
t_{PUP}	Time required after V_{CC} is stable before the device can accept commands	100	—	μ s
V_{POR}	Power-on Reset Threshold Voltage	—	1.5	V
t_{POFF}	Minimum time at $V_{CC} = 0V$ between power cycles	500	—	ms

Note:

- These parameters are characterized but they are not 100% tested in production.

If an event occurs in the system where the V_{CC} level supplied to the AT93C56B/AT93C66B drops below the maximum V_{POR} level specified, it is recommended that a full power cycle sequence be performed by first driving the V_{CC} pin to GND, waiting at least the minimum t_{POFF} time and then performing a new power-up sequence in compliance with the requirements defined in this section.

4.6.2 Pin Capacitance

Table 4-5. Pin Capacitance⁽¹⁾

Symbol	Test Condition	Max.	Units	Conditions
C_{OUT}	Output Capacitance (DO)	5	pF	$V_{OUT} = 0V$
C_{IN}	Input Capacitance (CS, SK, DI, ORG)	5	pF	$V_{IN} = 0V$

Note:

- This parameter is characterized but is not 100% tested in production.

4.6.3 EEPROM Cell Performance Characteristics

Table 4-6. EEPROM Cell Performance Characteristics

Operation	Test Condition	Min.	Max.	Units
Write Endurance ⁽¹⁾	$T_A = 25^\circ C$, $V_{CC} = 5.0V$	1,000,000	—	Write Cycles
Data Retention ⁽¹⁾	$T_A = 55^\circ C$	100	—	Years

Note:

- Performance is determined through characterization and the qualification process.

5. Device Commands and Addressing

The AT93C56B/AT93C66B is accessed via a simple and versatile three-wire serial communication interface. Device operation is controlled by seven instructions issued by the Host processor. A valid instruction starts with a rising edge of CS and consists of a Start bit (SB), followed by the appropriate opcode, and the desired memory address location.

Table 5-1. AT93C56B/AT93C66B Instruction Set

Instruction	SB	Opcode	Address		Data		Comments
			X8 ⁽¹⁾	X16 ⁽¹⁾	X8	X16	
READ	1	10	A ₈ -A ₀	A ₇ -A ₀			Reads data stored in memory at specified address.
EWEN	1	00	11XXXXXXXX	11XXXXXXX			Write Enable must precede all programming modes.
ERASE	1	11	A ₈ -A ₀	A ₇ -A ₀			Erases memory location A _N -A ₀ .
WRITE	1	01	A ₈ -A ₀	A ₇ -A ₀	D ₇ -D ₀	D ₁₅ -D ₀	Writes memory location A _N -A ₀ .
ERAL	1	00	10XXXXXXXX	10XXXXXXX			Erases all memory locations. Valid only at V _{CC3} . See Table 4-2 .
WRAL	1	00	01XXXXXXXX	01XXXXXXX	D ₇ -D ₀	D ₁₅ -D ₀	Writes all memory locations. Valid only at V _{CC3} . See Table 4-2 .
EWDS	1	00	00XXXXXXXX	00XXXXXXX			Disables all programming instructions.

Note:

- The 'x' in the address field represents a "don't care" bit and must be sent to the device.

Table 5-2. Organization Key for Timing Diagrams

I/O	AT93C56B (2K)		AT93C66B (4K)	
	x8	x16	x8	x16
A _N	A ₈ ⁽¹⁾	A ₇ ⁽²⁾	A ₈	A ₇
D _N	D ₇	D ₁₅	D ₇	D ₁₅

Note:

- A₈ is a "don't care" value, but the extra clock is required.
- A₇ is a "don't care" value, but the extra clock is required.

5.1 READ

The READ instruction contains the address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the DO pin. Output data changes are synchronized with the rising edges of the SK pin. The AT93C56B/AT93C66B supports sequential read operations. The device will automatically increment the internal Address Pointer and clock out the next memory location as long as Chip Select (CS) is held high. In this case, the dummy bit (Logic '0') will not be clocked out between memory locations, thus allowing for a continuous stream of data to be read.

Note: A dummy bit (logic '0') precedes the initial 8-bit or 16-bit data output string.

Figure 5-1. READ Timing

5.2 Erase/Write Enable (EWEN)

To ensure data integrity, the part automatically goes into the Erase/Write Disable (**EWDS**) state when power is first applied. An Erase/Write Enable (**EWEN**) instruction must be executed first before any programming instructions can be carried out.

Note: Once in the write enabled state, programming remains enabled until an **EWDS** instruction is executed, or V_{CC} power is removed from the part.

Figure 5-2. EWEN Timing

5.3 Erase/Write Disable (EWDS)

To protect against accidental data disturbance, the Erase/Write Disable (**EWDS**) instruction disables all programming modes and should be executed after all programming operations. The operation of the **READ** instruction is independent of both the **EWEN** and **EWDS** instructions and can be executed at any time.

Figure 5-3. EWDS Timing

5.4 ERASE

The **ERASE** instruction programs all bits in the specified memory location to the logic '1' state. The self-timed erase cycle starts once the **ERASE** instruction and address are decoded. The **DO** pin outputs the Ready/Busy status of the part if **CS** is brought high after being kept low for a minimum of t_{CS} . A logic '1' at the **DO** pin indicates that the selected memory location has been erased, and the part is ready for another instruction.

Figure 5-4. ERASE Timing

5.5 WRITE

The **WRITE** instruction contains the 8 bits or 16 bits of data to be written into the specified memory location. The self-timed programming cycle, t_{WP} , starts after the last bit of data is received at **DI** pin. The **DO** pin outputs the Ready/Busy status of the part if **CS** is brought high after being kept low for a minimum of t_{CS} . A logic '0' at **DO** indicates that programming is still in progress. A logic '1' indicates that the memory location at the specified address has been written with the data pattern contained in the instruction, and the part is ready for further instructions. A Ready/Busy status cannot be obtained if **CS** is brought high after the end of the self-timed programming cycle, t_{WP} .

Figure 5-5. WRITE Timing

5.6 Write All (WRAL)

The Write All (**WRAL**) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of t_{CS} .

Note: The **WRAL** instruction is valid only at V_{CC3} (see [Table 4-2](#)).

Figure 5-6. WRAL Timing

5.7 Erase All (ERAL)

The Erase All (**ERAL**) instruction programs every bit in the memory array to the logic '1' state and is primarily used for testing purposes. The DO pin outputs the Ready/Busy status of the part if CS is brought high after being kept low for a minimum of t_{CS} .

Note: The **ERAL** instruction is valid only at V_{CC3} (see [Table 4-2](#)).

Figure 5-7. ERAL Timing

Packaging Information

COMMON DIMENSIONS
(Unit of Measure - mm)

SYMBOL	MIN	NOM	MAX	NOTE
A	0.73	0.79	0.85	
A1	0.09	0.14	0.19	
A2	0.40	0.45	0.50	
b	0.20	0.25	0.30	2
D	1.50 BSC			
E	2.0 BSC			
e	0.50 BSC			
e1	0.25 REF			
d	1.00 BSC			
d1	0.25 REF			

Notes:

1. This drawing is for general information only.
2. Dimension 'b' is measured at maximum solder ball diameter.
3. Solder ball composition shall be 95.5Sn-4.0Ag-.5Cu.

7/1/14

TITLE	GPC	DRAWING NO.	REV.
8U3-1, 8-ball, 1.50mm x 2.00mm body, 0.50mm pitch, Very Thin, Fine-Pitch Ball Grid Array Package (VFBGA)	GXU	8U3-1	G

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>.

7. Revision History

Revision A (October 2019)

Updated to the Microchip template. Microchip DS20006260 replaces Atmel document 8735. Updated Package Marking Information. Removed lead finish designation. Updated trace code format in package markings. Updated section content throughout for clarification. Updated 8U3-1 VFBGA package drawing. Updated the SOIC, TSSOP, UDFN package drawings to Microchip format

Atmel 8735 Revision C (January 2015)

Added the UDFN extended quantity option and update package outline drawings. Update the 8MA2 package drawing.

Atmel 8735 Revision B (April 2013)

Corrected Synchronous Data Timing figure and removed note. Updated TSSOP package option from 8A2 to 8X. Updated UDFN package option from 8Y6 to 8MA2. Updated template and Atmel logos.

Atmel 8735 Revision A (January 2011)

Initial document release.

The Microchip Website

Microchip provides online support via our website at <http://www.microchip.com/>. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to <http://www.microchip.com/pcn> and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: <http://www.microchip.com/support>

Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Examples

Device	Package	Package Drawing Code	Package Option	Shipping Carrier Option	Device Grade

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
