

LM5112 Tiny 7A MOSFET Gate Driver

Check for Samples: [LM5112](#)

FEATURES

- Compound CMOS and Bipolar Outputs Reduce Output Current Variation
- 7A sink/3A Source Current
- Fast Propagation Times (25 ns Typical)
- Fast Rise and Fall Times (14 ns/12 ns Rise/Fall with 2 nF Load)
- Inverting and Non-inverting Inputs Provide Either Configuration with a Single Device
- Supply Rail Under-voltage Lockout Protection
- Dedicated Input Ground (IN_REF) for Split Supply or Single Supply Operation
- Power Enhanced 6-pin WSON Package (3.0mm x 3.0mm) or Thermally Enhanced MSOP-PowerPAD Package
- Output Swings from V_{CC} to V_{EE} Which can be Negative Relative to Input Ground

DESCRIPTION

The LM5112 MOSFET gate driver provides high peak gate drive current in the tiny WSON-6 package (SOT-23 equivalent footprint) or an 8-Lead exposed-pad MSOP package, with improved power dissipation required for high frequency operation. The compound output driver stage includes MOS and bipolar transistors operating in parallel that together sink more than 7A peak from capacitive loads. Combining the unique characteristics of MOS and bipolar devices reduces drive current variation with voltage and temperature. Under-voltage lockout protection is provided to prevent damage to the MOSFET due to insufficient gate turn-on voltage. The LM5112 provides both inverting and non-inverting inputs to satisfy requirements for inverting and non-inverting gate drive with a single device type.

Figure 3. MSOP-PowerPAD-8

PIN DESCRIPTIONS

Pin		Name	Description	Application Information
WSON-6	MSOP-8			
1	4	IN	Non-inverting input pin	TTL compatible thresholds. Pull up to VCC when not used.
2	3	VEE	Power ground for driver outputs	Connect to either power ground or a negative gate drive supply for positive or negative voltage swing.
3	6	VCC	Positive Supply voltage input	Locally decouple to VEE. The decoupling capacitor should be located close to the chip.
4	7	OUT	Gate drive output	Capable of sourcing 3A and sinking 7A. Voltage swing of this output is from VEE to VCC.
5	1	IN_REF	Ground reference for control inputs	Connect to power ground (VEE) for standard positive only output voltage swing. Connect to system logic ground when VEE is connected to a negative gate drive supply.
6	2	INB	Inverting input pin	TTL compatible thresholds. Connect to IN_REF when not used.
---	5, 8	N/C	Not internally connected	
---	---	Exposed Pad	Exposed Pad, underside of package	Internally bonded to the die substrate. Connect to VEE ground pin for low thermal impedance.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings⁽¹⁾⁽²⁾

V_{CC} to V_{EE}	–0.3V to 15V
V_{CC} to IN_REF	–0.3V to 15V
IN/INB to IN_REF	–0.3V to 15V
IN_REF to V_{EE}	–0.3V to 5V
Storage Temperature Range	–55°C to +150°C
Maximum Junction Temperature	+150°C
Operating Junction Temperature	–40°C to +125°C
ESD Rating	2kV

- (1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is intended to be functional. For ensured specifications and test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

Electrical Characteristics

$T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{CC} = 12\text{V}$, $INB = IN_REF = V_{EE} = 0\text{V}$, No Load on output, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
SUPPLY						
V_{CC}	V_{CC} Operating Range	$V_{CC} - IN_REF$ and $V_{CC} - V_{EE}$	3.5		14	V
UVLO	V_{CC} Under-voltage Lockout (rising)	$V_{CC} - IN_REF$	2.4	3.0	3.5	V
V_{CCH}	V_{CC} Under-voltage Hysteresis			230		mV
I_{CC}	V_{CC} Supply Current			1.0	2.0	mA
CONTROL INPUTS						
V_{IH}	Logic High		2.3			V
V_{IL}	Logic Low				0.8	V
V_{thH}	High Threshold		1.3	1.75	2.3	V
V_{thL}	Low Threshold		0.8	1.35	2.0	V
HYS	Input Hysteresis			400		mV
I_{IL}	Input Current Low	$IN = INB = 0\text{V}$	–1	0.1	1	μA
I_{IH}	Input Current High	$IN = INB = V_{CC}$	–1	0.1	1	μA
OUTPUT DRIVER						
R_{OH}	Output Resistance High	$I_{OUT} = -10\text{mA}^{(1)}$		30	50	Ω
R_{OL}	Output Resistance Low	$I_{OUT} = 10\text{mA}^{(1)}$		1.4	2.5	Ω
I_{SOURCE}	Peak Source Current	$OUT = V_{CC}/2$, 200ns pulsed current		3		A
I_{SINK}	Peak Sink Current	$OUT = V_{CC}/2$, 200ns pulsed current		7		A

- (1) The output resistance specification applies to the MOS device only. The total output current capability is the sum of the MOS and Bipolar devices.

Electrical Characteristics (continued)

$T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{CC} = 12\text{V}$, $\text{INB} = \text{IN_REF} = V_{EE} = 0\text{V}$, No Load on output, unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS

Figure 15.

The minimum recommended operating voltage between V_{CC} and IN_REF is 3.5V. An Under Voltage Lock Out (UVLO) circuit is included in the LM5112 which senses the voltage difference between V_{CC} and the input ground pin, IN_REF . When the V_{CC} to IN_REF voltage difference falls below 2.8V the driver is disabled and the output pin is held in the low state. The UVLO hysteresis prevents chattering during brown-out conditions; the driver will resume normal operation when the V_{CC} to IN_REF differential voltage exceeds 3.0V.

Layout Considerations

Attention must be given to board layout when using LM5112. Some important considerations include:

1. A Low ESR/ESL capacitor must be connected close to the IC and between the V_{CC} and V_{EE} pins to support high peak currents being drawn from V_{CC} during turn-on of the MOSFET.
2. Proper grounding is crucial. The driver needs a very low impedance path for current return to ground avoiding inductive loops. Two paths for returning current to ground are a) between LM5112 IN_REF pin and the ground of the circuit that controls the driver inputs and b) between LM5112 V_{EE} pin and the source of the power MOSFET being driven. Both paths should be as short as possible to reduce inductance and be as wide as possible to reduce resistance. These ground paths should be distinctly separate to avoid coupling between the high current output paths and the logic signals that drive the LM5112. With rise and fall times in the range of 10 to 30nsec, care is required to minimize the lengths of current carrying conductors to reduce their inductance and EMI from the high di/dt transients generated when driving large capacitive loads.
3. If either channel is not being used, the respective input pin (IN or INB) should be connected to either V_{EE} or V_{CC} to avoid spurious output signals.

Thermal Performance

INTRODUCTION

The primary goal of the thermal management is to maintain the integrated circuit (IC) junction temperature (T_j) below a specified limit to ensure reliable long term operation. The maximum T_j of IC components should be estimated in worst case operating conditions. The junction temperature can be calculated based on the power dissipated on the IC and the junction to ambient thermal resistance θ_{JA} for the IC package in the application board and environment. The θ_{JA} is not a given constant for the package and depends on the PCB design and the operating environment.

DRIVE POWER REQUIREMENT CALCULATIONS IN LM5112

LM5112 is a single low side MOSFET driver capable of sourcing / sinking 3A / 7A peak currents for short intervals to drive a MOSFET without exceeding package power dissipation limits. High peak currents are required to switch the MOSFET gate very quickly for operation at high frequencies.

The schematic above shows a conceptual diagram of the LM5112 output and MOSFET load. Q1 and Q2 are the switches within the gate driver. R_G is the gate resistance of the external MOSFET, and C_{in} is the equivalent gate capacitance of the MOSFET. The equivalent gate capacitance is a difficult parameter to measure as it is the combination of C_{gs} (gate to source capacitance) and C_{gd} (gate to drain capacitance). The C_{gd} is not a constant and varies with the drain voltage. The better way of quantifying gate capacitance is the gate charge Q_g in coulombs. Q_g combines the charge required by C_{gs} and C_{gd} for a given gate drive voltage V_{gate} . The gate resistance R_g is usually very small and losses in it can be neglected. The total power dissipated in the MOSFET driver due to gate charge is approximated by:

$$P_{DRIVER} = V_{GATE} \times Q_g \times F_{SW}$$

where

- F_{SW} = switching frequency of the MOSFET (1)

For example, consider the MOSFET MTD6N15 whose gate charge specified as 30 nC for $V_{GATE} = 12V$.

Therefore, the power dissipation in the driver due to charging and discharging of MOSFET gate capacitances at switching frequency of 300 kHz and V_{GATE} of 12V is equal to

$$P_{DRIVER} = 12V \times 30 \text{ nC} \times 300 \text{ kHz} = 0.108W. \quad (2)$$

In addition to the above gate charge power dissipation, - transient power is dissipated in the driver during output transitions. When either output of the LM5112 changes state, current will flow from V_{CC} to V_{EE} for a very brief interval of time through the output totem-pole N and P channel MOSFETs. The final component of power dissipation in the driver is the power associated with the quiescent bias current consumed by the driver input stage and Under-voltage lockout sections.

Characterization of the LM5112 provides accurate estimates of the transient and quiescent power dissipation components. At 300 kHz switching frequency and 30 nC load used in the example, the transient power will be 8 mW. The 1 mA nominal quiescent current and 12V V_{GATE} supply produce a 12 mW typical quiescent power.

Therefore the total power dissipation

$$P_D = 0.118 + 0.008 + 0.012 = 0.138W. \quad (3)$$

We know that the junction temperature is given by

$$T_J = P_D \times \theta_{JA} + T_A \quad (4)$$

Or the rise in temperature is given by

$$T_{RISE} = T_J - T_A = P_D \times \theta_{JA} \quad (5)$$

For WSON-6 package, the integrated circuit die is attached to leadframe die pad which is soldered directly to the printed circuit board. This substantially decreases the junction to ambient thermal resistance (θ_{JA}). By providing suitable means of heat dispersion from the IC to the ambient through exposed copper pad, which can readily dissipate heat to the surroundings, θ_{JA} as low as 40°C / Watt is achievable with the package. The resulting Trise for the driver example above is thereby reduced to just 5.5 degrees.

Therefore T_{RISE} is equal to

$$T_{RISE} = 0.138 \times 40 = 5.5^\circ C \quad (6)$$

For MSOP-PowerPAD θ_{JA} is typically 60°C/W.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
