

LMK03328 Ultra-Low Jitter Clock Generator with Two Independent PLLs, Eight Outputs, Integrated EEPROM

1 Features

- Ultra Low Noise, High Performance
 - Jitter: 100 fs RMS typical, $F_{out} > 100$ MHz
 - PSRR: -70 dBc, robust supply noise immunity
- Flexible Device Options
 - Up to 8 AC-LVPECL, AC-LVDS, AC-CML, HCSL or LVCMOS outputs or any combination
 - Pin mode, I²C mode, EEPROM mode
 - 71 pin selectable pre-programmed default startup options
- Dual Inputs with automatic or manual selection
 - Crystal input: 10 to 52 MHz
 - External input: 1 to 300 MHz
- Frequency Margining Options
 - Fine frequency margining (± 50 ppm typ) using low-cost pullable crystal reference
 - Glitchless coarse frequency margining (%) using output dividers
- Other Features
 - Supply: 3.3-V core, 1.8/2.5/3.3-V output supply
 - Industrial temperature range (-40°C to +85°C)
 - Package: 7 mm x 7 mm 48-QFN

2 Applications

- Switches & Routers
- Network & Telecom Line Cards
- Servers & Storage Systems
- Wireless Base Station

3 Description

The LMK03328 is an ultra-low-noise clock generator with two fractional-N frequency synthesizers with integrated VCOs, flexible clock distribution/fanout, and pin-selectable configuration states stored in on-chip EEPROM. The device can generate multiple clocks for various multi-gigabit serial interfaces and digital devices, reduces BOM cost and board area, and improves reliability by replacing multiple oscillators and clock distribution devices. The ultra-low-jitter reduces bit error rate (BER) in high-speed serial links.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMK03328	48-QFN	7.00 mm x 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

August 2015	*	Initial release.

5 Description Continued

For each PLL, a differential/single-ended clock or crystal input can be selected as the PLL reference clock. The selected PLL reference input can be used to lock the VCO frequency at an integer or fractional multiple of the reference input frequency. The VCO frequency for the respective PLLs can be tuned between 4.8-GHz and 5.4-GHz. Both PLL/VCOs are equivalent in performance and functionality. Each PLL offers the flexibility to select a predefined or user-defined loop bandwidth, depending on the needs of the application. Each PLL has a post-divider that can be selected between divide-by 2, 3, 4, 5, 6, 7 or 8.

All the output channels can select the divided-down VCO clock from PLL 1 or PLL 2 as the source for the output divider to set the final output frequency. Some output channels can also independently select the reference input for PLL 1 or PLL 2 as an alternative source to be bypassed to the corresponding output buffers. The 8-bit output dividers support a divide range of 1 to 256 (even or odd), output frequencies up to 1-GHz, and output phase synchronization capability.

All output pairs are ground-referenced CML drivers with programmable swing that can be interfaced to LVDS or LVPECL or CML receivers with AC coupling. All output pairs can also be independently configured as HCSL outputs or 2x 1.8-V LVCMOS outputs. The outputs offer lower power at 1.8-V, higher performance and power supply noise immunity, and lower EMI compared to voltage-referenced driver designs (such as traditional LVDS and LVPECL drivers). Two additional 3.3-V LVCMOS outputs can be obtained via the STATUS pins. This is an optional feature in case of a need for 3.3-V LVCMOS outputs and device status signals are not needed.

The device features self startup from on-chip programmable EEPROM or pre-defined ROM memory, which offers multiple custom device modes selectable via pin control and can eliminate the need for serial programming. The device registers and on-chip EEPROM settings are fully programmable via I²C-compatible serial interface. The device slave address is programmable in EEPROM and LSBs are settable with a 3-state pin.

The device provides two frequency margining options with glitch-free operation to support system design verification tests (DVT), such as standard compliance and system timing margin testing. Fine frequency margining (in ppm) can be supported by using a low-cost pullable crystal on the internal crystal oscillator (XO), and selecting this input as the reference to the PLL synthesizer. The frequency margining range is determined by the crystal's trim sensitivity and the on-chip varactor range. XO frequency margining can be controlled through pin or I²C control for ease-of-use and high flexibility. Coarse frequency margining (in %) is available on any output channel by changing the output divide value via I²C interface, which synchronously stops and restarts the output clock to prevent a glitch or runt pulse when the divider is changed.

Internal power conditioning provide excellent power supply ripple rejection (PSRR), reducing the cost and complexity of the power delivery network. The analog and digital core blocks operate from 3.3-V $\pm$ 5% supply and output blocks operate from 1.8-V / 2.5-V / 3.3-V $\pm$ 5% supply.

6 Pin Configuration and Functions

Pin Functions

NO.	NAME	TYPE	DESCRIPTION
POWER			
n/a	DAP	Ground	Die Attach Pad. The DAP is an electrical connection and provides a thermal dissipation path. For proper electrical and thermal performance of the device, a 6x6 via pattern (0.3-mm holes) is recommended to connect the DAP to multiple ground layers of the PCB. Refer to Layout Guidelines .
5	VDD_IN	Analog	3.3-V Power Supply for Input Block
36	VDD_PLL1	Analog	3.3-V Power Supply for PLL/VCO 1
27	VDD_PLL2	Analog	3.3-V Power Supply for PLL/VCO 2
4	VDD_DIG	Analog	3.3-V Power Supply for Digital Control and STATUS outputs
18	VDDO_01	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT0/OUT1 channel
19	VDDO_23	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT2/OUT3 channel
37	VDDO_4	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT4 channel
40	VDDO_5	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT5 channel
43	VDDO_6	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT6 channel
46	VDDO_7	Analog	1.8-V / 2.5-V / 3.3-V Power Supply for OUT7 channel
INPUT BLOCK			
8	REFSEL	LVC MOS	Manual reference input selection for PLL1 and PLL2 (3-state) Weak pullup resistor.

Pin Functions (continued)

NO.	NAME	TYPE	DESCRIPTION
9	HW_SW_CTRL	LVC MOS	Selection for Hard Pin Mode (ROM), Soft Pin Mode (EEPROM), or Register Default Mode. Weak pullup resistor.
6, 7	PRIREF_P, PRIREF_N	Universal	Primary reference clock. Accepts a differential or single-ended input. Input pins have AC coupling capacitors and biasing internally. For LVC MOS input, the non-driven input pin should be pulled-down to ground.
10, 11	SECREP_P, SECREP_N	Universal	Secondary reference clock. Accepts a differential or single-ended input or Crystal input. Input pins have AC coupling capacitors and biasing internally. For LVC MOS input, external input termination is needed to attenuate the swing to less than 2.6-V, and the non-driven input pin should be pulled-down to ground. For crystal input, AT cut fundamental crystal should be used as per defined spec and pullable crystal should be used for fine-margining.
SYNTHESIZER BLOCK			
34, 29	LF1, LF2	Analog	External Loop Filter for PLL1 and PLL2
35, 28	CAP_PLL1, CAP_PLL2	Analog	External Bypass Capacitors for PLL1 and PLL2. Attach a 10-uF to GND on each pin.
3	CAP_DIG	Analog	External Bypass Capacitor for digital blocks. Attach a 10-uF to GND.
OUTPUT BLOCK			
14, 15	OUT0_P, OUT0_N	Universal	Differential/LVC MOS Output Pair 0. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
17, 16	OUT1_P, OUT1_N	Universal	Differential/LVC MOS Output Pair 1. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
20, 21	OUT2_P, OUT2_N	Universal	Differential/LVC MOS Output Pair 2. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
23, 22	OUT3_P, OUT3_N	Universal	Differential/LVC MOS Output Pair 3. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
39, 38	OUT4_P, OUT4_N	Universal	Differential/LVC MOS Output Pair 4. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
42, 41	OUT5_P, OUT5_N	Universal	Differential/LVC MOS Output Pair 5. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
45, 44	OUT6_P, OUT6_N	Universal	Differential/LVC MOS Output Pair 6. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
48, 47	OUT7_P, OUT7_N	Universal	Differential/LVC MOS Output Pair 7. Programmable driver with differential or 2x 1.8-V LVC MOS outputs.
DIGITAL CONTROL / INTERFACES⁽¹⁾			
33	GPIO5	Universal	Multifunction Input (2-state) or Analog input for frequency margin
12	GPIO0	LVC MOS	Multifunction Inputs (2-state)
31, 30, 24	GPIO3, GPIO2, GPIO1	LVC MOS	Multifunction Inputs (3-state or 2-state)
32	GPIO4	LVC MOS	Multifunction Input (2-state)
13	PDN	LVC MOS	Device Power-down (active low). Weak pullup resistor.
25	SDA	LVC MOS	I ² C Serial Data (bi-directional, open drain). Requires an external pull-up resistor to VDD_DIG. I ² C slave address is initialized from on-chip EEPROM.
26	SCL	LVC MOS	I ² C Serial Clock (bi-directional, open drain). Requires an external pull-up resistor to VDD_DIG.
1	STATUS0	Universal	Status Output 0 (open drain, requires external pullup) or 3.3-V LVC MOS output from synth (push-pull) Status signal selection and output polarity are programmable.
2	STATUS1	Universal	Status Output 1 (open drain, requires external pullup) or 3.3-V LVC MOS output from synth (push-pull) Status signal selection and output polarity are programmable.

(1) Refer to [Detailed Description](#) for details on the digital control/interfaces.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Supply Voltage for Input, Synthesizer, Control, and Output Blocks, VDD_IN, VDD_PLL1, VDD_PLL2, VDD_DIG, VDDO_x	-0.3	3.6	V
Input Voltage Range, Clock and Logic Inputs, Vin	-0.3	VDD +0.3	V
Output Voltage Range for Clock and Logic Outputs, Vout	-0.3	VDD + 0.3	V
Junction Temperature, TJ		150	°C
Storage temperature, Tstg	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD_IN, VDD_PLL1, VDD_PLL2, VDD_DIG	Supply Voltage for Input, Analog, Control Blocks	3.135	3.3	3.465	V
VDDO_x	Supply Voltage for Output Drivers (Differential, LVCMOS)	1.7	1.8 2.5 3.3	3.465	V
TA	Ambient Temperature	-40	25	85	°C
TJ	Junction Temperature			125	°C
dVDD/dt	Maximum VDD Power-Up Ramp	0.1		100	ms
WR	EEPROM number of writes			100	

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		CONDITION	LMK03328	UNIT
			RHA

7.6 Pullable Crystal Characteristics (SECREP_P, SECREP_N)⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{XTAL}	Crystal Frequency	Fundamental Mode	10		52	MHz
ESR	Equivalent Series Resistance	f _{XTAL} = 10-MHz to 16-MHz			60	Ω
		f _{XTAL} = 16-MHz to 30-MHz			50	
		f _{XTAL} = 30-MHz to 52-MHz			30	
C _L	Load Capacitance	Recommended Crystal specifications		9		pF
C ₀	Shunt Capacitance			2.1		pF
C ₀ /C ₁	Shunt capacitance to motional capacitance ratio			220	250	
P _{XTAL}	Crystal Max Drive Level				300	uW
C _{XO}	On-Chip XO Input Capacitance at SECREP_P and SECREP_N	Single-ended, each pin referenced to GND	14		24	pF
Trim	Trim Sensitivity	C _L = 9-pF, f _{XTAL} = 50-MHz		25		ppm/pF
		C _L = 9-pF, f _{XTAL} = 25-MHz		35		
C _{on-chip-5p-load}	On-chip tunable capacitor variation over VT across crystal load of 5-pF	Frequency accuracy of crystal over temperature, aging and initial accuracy < +/- 25-ppm.			450	fF
C _{on-chip-11p-load}	On-chip tunable capacitor variation over VT across crystal load of 12-pF	Frequency accuracy of crystal over temperature, aging and initial accuracy < +/- 25-ppm.			1.5	pF
f _{PR}	Pulling range	Crystal C0/C1 < 250		± 50		ppm

- (1) Parameter is specified by characterization and is not tested in production.
- (2) The crystal pullability ratio is considered in the case where the XO frequency margining option is enabled. The actual pull range depends on the crystal pullability, as well as on-chip capacitance (C_{on-chip}), device crystal oscillator input capacitance (C_{XO}), PCB stray capacitance (C_{PCB}), and any installed on-board tuning capacitance (C_{TUNE}). Trim Sensitivity or Pullability (ppm/pF), TS = C₁ * 1e6 / [2 * (C₀ + C_L)²]. If the total external capacitance is less than the crystal C_L, the crystal will oscillate at a higher frequency than the nominal crystal frequency. If the total external capacitance is higher than C_L, the crystal will oscillate at a lower frequency than nominal.
- (3) Using a crystal with higher ESR can degrade output phase noise and may impact crystal start-up.
- (4) Verified with crystals specified for a load capacitance of C_L = 9-pF. PCB stray capacitance was measured to be 1-pF. Crystals tested: 19.2-MHz TXC (Part Number: 7M19272001), 19.44-MHz TXC (Part Number: 7M19472001), 25-MHz TXC (Part Number: 7M25072001), 38.88-MHz TXC (Part Number: 7M38872001), 49.152-MHz TXC (Part Number: 7M49172001), 50-MHz TXC (Part Number: 7M50072001).

7.7 Non-Pullable Crystal Characteristics (SECREP_P, SECREP_N)⁽¹⁾⁽²⁾⁽³⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{XTAL}	Crystal Frequency	Fundamental Mode	10		52	MHz
ESR	Equivalent Series Resistance	f _{XTAL} = 10-MHz to 16-MHz			60	Ω
		f _{XTAL} = 16-MHz to 30-MHz			50	
		f _{XTAL} = 30-MHz to 52 -MHz			30	
P _{XTAL}	Crystal Max Drive Level				300	uW
C _{XO}	On-Chip XO Input Capacitance at Xi and Xo	Single-ended, each pin referenced to GND	14		24	pF
C _{on-chip-5p-load}	On-chip tunable capacitor variation over VT across crystal load of 5-pF	Frequency accuracy of crystal over temperature, aging and initial accuracy < +/- 25-ppm.			450	fF

- (1) Parameter is specified by characterization and is not tested in production.
- (2) Using a crystal with higher ESR can degrade XO phase noise and may impact crystal start-up.
- (3) Verified with crystals specified for a load capacitance of C_L = 9-pF. PCB stray capacitance was measured to be 1-pF. Crystal tested: 25-MHz TXC (Part Number: 7M25072001).

Non-Pullable Crystal Characteristics (SECREP_P, SECREP_N)⁽¹⁾⁽²⁾⁽³⁾ (continued)

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

		Single-ended input, non-driven input tied to GND	0.5			V/ns
IDC ⁽²⁾	Input Clock Duty Cycle		40		60	%
I _{IN}	Input Leakage Current		-100		100	μA
C _{IN}	Input Capacitance	Single-ended, each pin		2		pF

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) Ensured by characterization.

7.9 PLL Characteristics

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{PD}	Phase Detector Frequency		1		150	MHz
PN1Hz	PLL Figure of Merit ⁽¹⁾			-231		dBc/Hz
PN10kHz	PLL 1/f noise at 10-kHz offset normalized to 1-GHz ⁽²⁾	I _{cp} = 6.4-mA. 25-MHz Phase Detector		-136		dBc/Hz
I _{CP-HIZ}	Charge Pump Leakage in Hi-Z Mode			55		nA

(1) PLL Flat Phase Noise = PN1-Hz + 20*log(N) + 10*log(f_{PD}), with wide loop bandwidth and away from 1/f noise region.

(2) Phase Noise normalized to 1-GHz. PLL 1/f Phase Noise = PN10-kHz + 20*log(Fout/1-GHz) - 10*log(offset/10-kHz)

7.10 VCO Characteristics

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{VCO}	Frequency Range		4.8		5.4	GHz
K _{VCO}	VCO Gain			55		MHz/V

7.11 1.8V LVCMOS Output Characteristics (OUT[7:0])⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, outputs loaded with 2-pF to GND

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency		1		200	MHz
V _{OH} ⁽²⁾	Output High Voltage	I _{OH} = 1-mA	1.35			V
V _{OL}	Output Low Voltage	I _{OL} = 1-mA			0.35	V
I _{OH}	Output High Current			21		mA
I _{OL}	Output Low Current			-21		mA
t _R /t _F	Output Rise/Fall Time	20% to 80%		250		ps
t _{SKW} ⁽³⁾	Output-to-output skew	same divide value			100	ps
t _{SKW} ⁽³⁾	Output-to-output skew	LVCMOS-to-differential; same divide value			1.5	ns
t _{PROP-CMOS}	IN-to-OUT Propagation Delay	PLL Bypass		1		ns
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)	66.66-MHz		-155		dBc/Hz
ODC ⁽³⁾	Output Duty Cycle		45		55	%
R _{OUT}	Output Impedance			50		Ohm

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) V_{OH} level is NOT rail-to-rail for VDDO = 2.5-V or 3.3-V, 1.8-V LVCMOS output buffer supply is internally regulated down to 1.8-V.

(3) Ensured by characterization.

7.12 LVCMOS Output Characteristics (STATUS[1:0])⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDD_O = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, outputs loaded with 2-pF to GND

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency		3.75		200	MHz
V _{OH}	Output High Voltage	I _{OH} = 1-mA	2.5			V

		20% to 80%, R49[3-2], R49[1:0] = "00"		0.35		ns
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)	66.66-MHz		-148		dBc/Hz
ODC ⁽²⁾	Output Duty Cycle		45		55	%
R _{OUT}	Output Impedance			50		Ohm

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) Ensured by characterization.

7.13 Open-Drain Output Characteristics (STATUS[1:0])

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_x = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OL}	Output Low Voltage				0.6	V

7.14 AC-LVPECL Output Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_X = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, output pair AC-coupled to 100-ohm differential load

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency ⁽²⁾		1		1000	MHz
V _{OD}	Output Voltage Swing		500	800	1000	mV
V _{OUT-PP}	Differential Output Peak-to-Peak Swing		2 x V _{OD}			V
V _{OS}	Output Common Mode		0.3		0.7	mV
t _{SKEW} ⁽³⁾	Output-to-output skew	LVPECL-to-LVPECL; same divide value			60	ps
t _{PROP-DIFF}	IN-to-OUT Propagation Delay	PLL Bypass		400		ps
t _R /t _F ⁽³⁾	Output Rise/Fall Time	20% to 80%, < 300-MHz		175	300	ps
		+/- 100-mV around center point, > 300-MHz			200	ps
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)			-164		dBc/Hz
ODC ⁽³⁾	Output Duty Cycle		45		55	%

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) An output frequency over f_{OUT} max spec is possible, but output swing may be less than V_{OD} min spec.

(3) Ensured by characterization.

7.15 AC-LVDS Output Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_X = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, output pair AC-coupled to 100-ohm differential load

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency ⁽²⁾		1		800	MHz
V _{OD}	Output Voltage Swing		250	400	450	mV
V _{OUT-PP}	Differential Output Peak-to-Peak Swing		2 x V _{OD}			V
V _{OS}	Output Common Mode		0.1		0.35	mV
t _{SKEW} ⁽²⁾	Output-to-output skew	LVDS-to-LVDS; same divide value			60	ps
t _{PROP-DIFF}	IN-to-OUT Propagation Delay	PLL Bypass		400		ps
t _R /t _F ⁽³⁾	Output Rise/Fall Time	20% to 80%, < 300-MHz		200	300	ps
		+/- 100-mV around center point, > 300-MHz			200	ps
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)			-160		dBc/Hz
ODC ⁽³⁾	Output Duty Cycle		45		55	%

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) An output frequency over f_{OUT} max spec is possible, but output swing may be less than V_{OD} min spec.

(3) Ensured by characterization.

7.16 AC-CML Output Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_X = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, output pair AC-coupled to 100-ohm differential load

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency ⁽²⁾		1		1000	MHz
V _{OD}	Output Voltage Swing		400	600	1000	mV
V _{SS}	Differential Output Peak-to-Peak Swing		2 x V _{OD}			V
V _{OS}	Output Common Mode		0.15		0.55	mV
t _{SKW} ⁽³⁾	Output-to-output skew	CML-to-CML; same divide value			60	ps
t _{PROP-DIFF}	IN-to-OUT Propagation Delay	PLL Bypass		400		ps
t _R /t _F ⁽³⁾	Output Rise/Fall Time	20% to 80%, < 300-MHz		190	300	ps
		+/- 100-mV around center point, > 300-MHz			200	ps
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)	CML swing		-160		dBc/Hz
ODC ⁽³⁾	Output Duty Cycle		45		55	%

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) An output frequency over f_{OUT} max spec is possible, but output swing may be less than V_{OD} min spec.

(3) Ensured by characterization.

7.17 HCSL Output Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V ± 5%, VDDO_X = 1.8-V ± 5%, 2.5-V ± 5%, 3.3-V ± 5%, T_A = -40°C to 85°C, outputs with 50-ohms || 2-pF to GND.

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{OUT}	Output Frequency		1		400	MHz
V _{OH}	Output High Voltage ⁽²⁾		660		850	mV
V _{OL}	Output Low Voltage ⁽²⁾		-150		150	mV
V _{CROSS}	Absolute Crossing Voltage ⁽³⁾	100-MHz	250		550	mV
V _{CROSS-DELTA}	Variation of V _{CROSS} ⁽³⁾	100-MHz	0		140	mV
t _{SKW} ⁽⁴⁾	Output-to-output skew	same divide value			100	ps
t _{PROP-DIFF}	IN-to-OUT Propagation Delay	PLL Bypass		400		ps
dV/dt ⁽⁴⁾	Slew Rate ⁽²⁾	100-MHz	2.25		5	V/ns
PN-Floor	Output Phase Noise Floor (f _{OFFSET} > 10-MHz)	100-MHz		-158		dBc/Hz
ODC ⁽⁴⁾	Output Duty Cycle	100-MHz	45		55	%

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) Measured from -150-mV to +150-mV on the differential waveform (OUT minus nOUT) with the 300-mVpp measurement window centered on the differential zero crossing.

(3) Ensured by design.

(4) Ensured by characterization.

7.18 Power-On/Reset Characteristics

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V $\pm$ 5%, VDDO_x = 1.8-V $\pm$ 5%, 2.5-V $\pm$ 5%, 3.3-V $\pm$ 5%, T_A = -40°C to 85°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{THRESH}	Threshold Voltage		2.72		2.95	V
V _{DROOP}	Allowable Voltage Droop				0.1	V
t _{START-XTAL}	Startup Time with 25-MHz XTAL	Measured from time of supply reaching 3.135-V to time of output frequency accurate to +/- 300-ppm			10	ms
t _{START-CLK}	Startup Time with 25-MHz Clock Input	Measured from time of supply reaching 3.135-V to time of output frequency accurate to +/- 300-ppm			10	ms

7.19 2-Level Logic Input Characteristics (HW_SW_CTRL, PDN, GPIO[5:0])

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V $\pm$ 5%, VDDO_x = 1.8-V $\pm$ 5%, 2.5-V $\pm$ 5%, 3.3-V $\pm$ 5%, T_A = -40°C to 85°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IH}	Input High Voltage		1.2			V
V _{IL}	Input Low Voltage				0.6	V
I _{IH}	Input High Current	V _{IH} = VDD_DIG	-40		40	μA

phn100k	Phase noise at 100-kHz offset	-140	-140	-140	-140	-140	dBc/Hz
phn500k	Phase noise at 500-kHz offset	-142	-142	-142	-142	-142	dBc/Hz
phn1M	Phase noise at 1-MHz offset	-150	-150	-150	-149	-149	dBc/Hz
phn5M	Phase noise at 5-MHz offset	-160.5	-160	-160	-159	-158	dBc/Hz
phn20M	Phase noise at 20-MHz offset	-164.5	-164	-164	-161	-159	dBc/Hz

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

(2) Jitter specifications apply for differential output formats with low-jitter differential input clock or crystal input. Phase jitter measured with Agilent E5052 signal source analyzer using a differential-to-single ended converter (balun or buffer).

7.25 Closed Loop Output Jitter Characteristics

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V $\pm$ 5%, VDDO_x = 1.8-V $\pm$ 5%, 2.5-V $\pm$ 5%, 3.3-V $\pm$ 5%, T_A = -40°C to 85°C, Integer-N PLL with 4.8-GHz, 4.9152-GHz, 4.97664-GHz, 5-GHz or 5.1-GHz VCO, 400-kHz PLL bandwidth and doubler enabled or disabled, Fractional-N PLL with 4.8-GHz, 4.9152-GHz, 4.944-GHz, 4.97664-GHz, 5-GHz, 5.15-GHz or 5.15625-GHz VCO, 400-kHz bandwidth and doubler enabled or disabled, 1.8-V or 3.3-V LVCMOS output load of 2-pF to GND, AC-LVPECL/AC-LVDS/CML output pair AC-coupled to 100-ohm differential load, HCSL outputs with 50-ohms || 2 pF to GND. ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
RJ	RMS Phase Jitter (12-kHz – 20-MHz) (1-kHz – 5-MHz)	19.2-MHz, 25-MHz, 27-MHz, 38.88-MHz input, Integer-N PLL1 or PLL2, f _{OUT} $\geq$ 100-MHz, all differential output types		120	200	fs RMS
RJ	RMS Phase Jitter (12-kHz – 20-MHz) (1-kHz – 5-MHz)	19.2-MHz, 25-MHz, 27-MHz, 38.88-MHz input, Fractional-N PLL1 or PLL2, f _{OUT} $\geq$ 100-MHz, all differential output types		200	350	fs RMS
RJ	RMS Phase Jitter (12-kHz – 20-MHz) or (12-kHz – 5-MHz)	f _{OUT} $\geq$ 10-MHz, 1.8-V LVCMOS output, Integer-N or Fractional-N PLL1 or PLL2			800	fs RMS

- (1) Phase jitter measured with Agilent E5052 source signal analyzer using a differential-to-single-ended converter (balun or buffer) for differential outputs.
- (2) Verified with crystals specified for a load capacitance of CL = 9-pF. PCB stray capacitance was measured to be 1-pF. Crystals tested: 19.44-MHz TXC (Part Number: 7M19472001), 25-MHz TXC (Part Number: 7M25072001), 38.88-MHz TXC (Part Number: 7M38872001).
- (3) Refer to [Parameter Measurement Information](#) for relevant test conditions.
- (4) For output frequency < 40-MHz, integration band for RMS phase jitter is 12-kHz – 5-MHz.

7.26 Typical Power Supply Noise Rejection Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V, VDDO_x = 3.3-V, T_A = 25°C, Reference Input = 50-MHz, PFD = 100-MHz, PLL bandwidth = 400-kHz, VCO Frequency = 5-GHz, Post Divider = 8, Output Divider = 4, AC-LVPECL/AC-LVDS/CML output pair AC-coupled to 100-ohm differential load, HCSL outputs with 50-ohms || 2-pF to GND, sinusoidal noise injected in either of the following supply nodes: VDD_IN, VDD_PLL, VDD_DIG or VDDO_x.

SYMBOL	PARAMETER	50-mV RIPPLE ON SUPPLY TYPE					UNIT
		VDD_IN	VDD_PLL1	VDD_PLL2	VDD_DIG	VDDO_x	
PSNR _{50k}	50-kHz spur on 156.25-MHz output	-82	-83	-83	-100	-83	dBc
PSNR _{100k}	100-kHz spur on 156.25-MHz output	-83	-82	-82	-100	-77	dBc
PSNR _{500k}	500-kHz spur on 156.25-MHz output	-72	-82	-82	-100	-75	dBc
PSNR _{1M}	1-MHz spur on 156.25-MHz output	-76	-83	-83	-100	-80	dBc

(1) Refer to [Parameter Measurement Information](#) for relevant test conditions.

7.27 Typical Power Supply Noise Rejection Characteristics⁽¹⁾

VDD_IN / VDD_PLL1 / VDD_PLL2 / VDD_DIG = 3.3-V, VDDO_x = 1.8-V, T_A = 25°C, Reference Input = 50-MHz, PFD = 100-MHz, PLL bandwidth = 400-kHz, VCO Frequency = 5-GHz, Post Divider = 8, Output Divider = 4, AC-LVPECL/AC-LVDS/CML output pair AC-coupled to 100-ohm differential load, HCSL outputs with 50-ohms || 2-pF to GND, sinusoidal noise injected in VDDO_x.

SYMBOL	PARAMETER	25-mV RIPPLE ON SUPPLY TYPE					UNIT

9 Detailed Description

9.1 Overview

9.2 Functional Block Diagram

NOTE

Input and Control blocks are compatible with 1.8/2.5/3.3 V I/O voltage levels.

9.3 Feature Description

9.3.1 Device Block-Level Description

The LMK03328 includes two on-chip fractional PLLs with integrated VCOs and each VCO supports a frequency range of 4.8-GHz to 5.4-GHz. Each PLL block consists of a input selection MUX, a phase frequency detector (PFD), charge pump, on-chip passive loop filter that only needs an external capacitor to ground, a feedback divider that can support both integer and fractional values and a delta-sigma engine for spur suppression in fractional PLL mode. The universal inputs support single ended and differential clocks in the frequencies of 1-MHz to 300-MHz and the secondary input additionally supports crystals in the frequencies of 10-MHz to 52-MHz. When the PLLs operate with the crystal as their reference, the output frequencies can be margined based on changing the on-chip capacitor loading on each leg of the crystal. Completing the device is the combination of integer output dividers and universal output buffers. The PLLs are powered by on-chip low dropout (LDO), linear voltage regulators and the regulated supply network is partitioned such that the sensitive analog supplies are running from separate LDOs than the digital supplies which use their own LDO. The LDOs provide isolation of the isolation of the PLL from any noise in the external power supply rail with a PSRR of better than -60-dB at 50-kHz to 1-MHz ripple frequencies at 1.8-V output supplies and better than -70-dB at 50-kHz to 1-MHz ripple frequencies at > 2.5-V output supplies. The regulator capacitor pins should each be connected to ground by 10-uF capacitors to ensure stability.

9.3.2 Device Configuration Control

[Figure 41](#) illustrates the relationships between device states, the configuration pins, device initialization and configuration, and device operational modes. In hard pin configuration mode, the state of the configuration pins determines the configuration of the device as selected from all device states programmed in the on-chip ROM. In soft pin configuration mode, the state of the configuration pins determines the initialized state of the device as programmed in the on-chip EEPROM. In either mode, the host can update any device configuration after the device enables the host interface and the host writes a sequence that updates the device registers. Once the device configuration is set, the host can also write to the on-chip EEPROM for a new set of powerup defaults based on the configuration pin settings in the soft pin configuration mode. A system may transition a device from hard pin mode to soft pin mode by changing the state of the HW_SW_CTRL pin and then triggering a device power cycling via the PDN pin. In reset mode, the device disables the outputs so that unwanted sporadic activity associated with device initialization does not appear on the device outputs.

Feature Description (continued)

Figure 41. LMK03328 Simplified Programming Flow

9.3.2.1 Hard Pin Mode (HW_SW_CTRL = 1)

In this mode, the GPIO[5:0] pins allow hardware pin configuration of the PLL synthesizer, its input clock selection and output frequency and type selection. I²C is still enabled and the LSB of device address is set to "00". The GPIO pins are 2-state and are sampled/latched at POR and the combination selects one of 64 page settings that are predefined in on-chip ROM. In this mode, automatic output divider and PLL post divider synchronization is performed on power-up or upon toggling PDN. [Table 13](#), [Table 14](#), [Table 15](#), [Table 16](#) and [Table 17](#) show the pre-defined ROM configurations according to the GPIO[5:0] pin settings.

Following are the blocks that are configured by the GPIO[5:0] pins.

9.3.2.1.1 PLL Blocks

Sets the PLL synthesizer frequency and loop bandwidth by configuring registers related to the PLL dividers, input frequency doubler, and PLL power-down.

Feature Description (continued)

9.3.2.1.2 Output Buffer Auto Mute

When an output MUX's selected source is invalid (e.g. selected PLL is unlocked or selected reference input is not present), the individual output mute controls will determine output mute state per the ROM default settings (CH_x_MUTE=0, CHx_MUTE_LVL=1):

1. In differential mode, the output will be resistively terminated to the DC common mode point of the output buffer for AC-LVPECL, AC-LVDS, and AC-CML output types and the output will be forced LOW for HCSL output type.
2. In CMOS mode, we will be assuming a DC connection to the receiver, so the output in a "mute" condition will be forced LOW.

9.3.2.1.3 Input Block

Sets the input type for primary and secondary inputs, selects input MUX type for each PLL and selects R divider values for primary input to each input MUX.

9.3.2.1.4 Channel Mux

Controls the channel mux selection for each channel.

9.3.2.1.5 Output Divider

Sets the 8-bit output divide value for each channel (/1 to /256)

9.3.2.1.6 Output Driver Format

Selects the output format for each driver pair, or disable channel.

9.3.2.1.7 Status MUX, Divider and Slew Rate

Selects the status pins as either 3.3-V LVCMOS PLL clock outputs or status outputs. When configured as LVCMOS clock outputs, selects divider values and rise/fall time settings.

9.3.2.2 Soft Pin Programming Mode (HW_SW_CTRL = 0)

In this mode, I²C is enabled and GPIO[3:2] are purposed as 3-state pins (tied to VDD_DIG, GND or V_{IM}) and used to select one of 6 EEPROM pages and one register default setting (2 of 9 states are invalid). GPIO[0] is also purposed as a 2-state output synchronization (active-low SYNCN) function, GPIO[1] is now purposed as a 3-state I²C address function to change last 2 bits of I²C address (ADD; 00 is GND, 01 is V_{IM}, and 11 is VDD_DIG). GPIO[5] is purposed as a multi-state input for the MARGIN function and GPIO[4] is purposed as an input that enables or disables hardware margining. The GPIO pins are sampled/latched at POR.

NOTE

No software reset or power cycling should occur during EEPROM programming or else it will be corrupted. Please refer to the "Interface and Control" section for more details on the EEPROM programming.

GPIO[3:2] allows hardware pin configuration for the PLL synthesizers, their respective input clock selection modes, the crystal input frequency margining option, all output channel blocks, comprised of channel muxes, dividers, and output drivers. The GPIO inputs[3:2] are sampled and latched at power-on/reset (POR), and selects one of 6 EEPROM pages, which are custom-programmable. When GPIO[3:2] are left floating, EEPROM is not used and the hardware register default settings are loaded. [Table 8](#), [Table 9](#), [Table 10](#), [Table 11](#) and [Table 12](#) show the pre-defined EEPROM configurations according to the GPIO[3:2] pin settings.

Below is a brief overview of each block's register settings configured by the GPIO[3:2] pin modes.

9.3.2.2.1 Device Config Space

8-b for unique identifier programmed to EEPROM

Feature Description (continued)

9.3.2.2.2 PLL Blocks

Sets the PLL synthesizer frequency and loop bandwidth by configuring registers related to the PLL dividers, input frequency doubler, and PLL power-down.

9.3.2.2.3 Output Buffer Auto Mute

When an output MUX's selected source is invalid (e.g. selected PLL is unlocked or selected reference input is not present), the individual output mute controls will determine output mute state per the EEPROM default settings (CH_x_MUTE=0, CHx_MUTE_LVL=1):

1. In differential mode, the output will be resistively terminated to the DC common mode point of the output buffer for AC-LVPECL, AC-LVDS, and AC-CML output types and the output will be forced LOW for HCSL output type.
2. In CMOS mode, we will be assuming a DC connection to the receiver, so the output in a "mute" condition will be forced LOW.

9.3.2.2.4 Input Block

Sets the input type for primary and secondary inputs, selects input MUX type for each PLL and selects R divider values for primary input to each input MUX.

9.3.2.2.5 Channel Mux

Controls the channel mux selection for each channel.

9.3.2.2.6 Output Divider

Sets the 8-bit output divide value for each channel (/1 to /256)

9.3.2.2.7 Output Driver Format

Selects the output format for each driver pair, or disable channel.

9.3.2.2.8 Status MUX, Divider and Slew Rate

Selects the status pins as either 3.3-V LVCMOS PLL clock outputs or status outputs. When configured as LVCMOS clock outputs, selects divider values and rise/fall time settings.

9.3.2.3 Register File Reference Convention

Figure 42 shows the method that this document employs to refer to an individual register bit or a grouping of register bits. If a drawing or text references an individual bit the format is to specify the register number first and the bit number second. The LMK03328 contains 124 registers that are 8 bits wide. The register addresses and the bit positions both begin with the number zero (0). A period separates the register address and bit address. The first bit in the register file is address 'R0.0' meaning that it is located in Register 0 and is bit position 0. The last bit in the register file is address 'R31.7' referring to the 8th bit of register address 31 (the 32nd register in the device). Figure 43 lists specific bit positions as a number contained within a box. A box with the register address encloses the group of boxes that represent the bits relevant to the specific device circuitry in context.

Figure 42. LMK03328 Register Reference Format

9.4 Configuring PLL1 and PLL2

The 2 PLLs in LMK03328 can be configured to accommodate various input and output frequencies either through I²C programming interface or in the absence of programming, the PLL can be configured by the ROM page, EEPROM page, or register default settings selected through the control pins. The PLLs can be configured by setting each's Smart Input MUX, Reference Divider, PLL Loop Filter, Feedback Divider, Prescaler Divider and Output Dividers.

For each PLL to operate in closed loop mode, the following condition in Equation 1 has to be met when using primary input or secondary input for the reference clock (F_{REF}).

$$F_{VCO} = (F_{REF}/R) \times D \times [(INT + NUM/DEN)/M]$$

where

- F_{VCO} : PLL/VCO Frequency
- F_{REF} : Frequency of selected reference input clock
- D: PLL input frequency doubler, 1=Disabled, 2=Enabled
- INT: PLL feedback divider integer value (12 bits, 1 to 4095)
- NUM: PLL feedback divider fractional numerator value (22 bits, 0 to 4194303)
- DEN: PLL feedback divider fractional denominator value (22 bits, 1 to 4194303)
- R: Primary reference divider value (3 bits, 1 to 8); R = 1 for secondary reference
- M: PLL reference input divider value (5 bits, 1 to 32)

(1)

The output frequency is related to the PLL/VCO frequency or the reference input frequency (based on the output MUX selection) as given in the following equations.

$$F_{OUT} = F_{REF} \text{ when reference input clock selected by OUTMUX}$$

(2)

$$F_{OUT} = F_{VCO} / (P \times OUTDIV) \text{ when PLL is selected by OUTMUX}$$

where

- OUTDIV: Output divider value (8 bits, 1 to 256)
- P: PLL post-divider value (2, 3, 4, 5, 6, 7, 8)

(3)

9.4.1 Smart Input MUX

Each PLL has a dedicated Smart Input MUX. The input selection mode per PLL can be configured using the 3-state REFSEL pin or programmed via I²C. The Smart Input MUX supports auto-switching and manual-switching using control pin (or through register). The Smart Input MUX is designed such that glitches created during switching in both auto and manual modes are suppressed at the MUX output.

In the automatic mode, the frequencies of both primary (PRIREF) and secondary (SECREF) input clocks have to be within 2000-ppm. The phase of the input clocks can be any. In order to minimize phase jump at the output, it is recommended to set very low PLL loop bandwidth, set R29.7 = "1", R51.7 = "1" and those outputs that are not be muted should have its respective mute bypass bit in R20 and R21 be set to "0" in order to ensure that these outputs are available during an input switchover event. In the case the primary reference is detected to be unavailable, the input MUX automatically switches from the primary reference to the secondary reference. When primary reference is detected to be available again, the input MUX switches back to the primary reference. When both primary and secondary references are detected as unavailable, the input MUX waits on secondary reference until either the primary or the secondary reference is detected as available again. In the case where both the primary and secondary reference inputs are detected as unavailable, LOS is active and the PLL outputs are automatically disabled. The timing diagram of an auto-switch at the input MUX is shown in Figure 43.

Figure 43. Smart Input MUX Auto-Switch Mode Timing Diagram

Configuring PLL1 and PLL2 (continued)

R50[3-0] are the register bits that control the smart input MUX for PLL2 and PLL1 respectively and can be programmed through I²C. [Table 1](#) shows the input clock selection options for both PLLs that are supported by the REFSEL pin or via I²C programming.

Table 1. Input Clock Selection via I²C Programming or REFSEL Pin

HW_SW_CTRL	R50.1 / R50.3	R50.0 / R50.2	REFSEL	MODE	PLL REFERENCE
X	0	0	X	Automatic	PLL1 and/or PLL2 prefers primary
X	0	1	0	Manual	PLL1 selects primary; PLL2 selects secondary
X	0	1	V _{IM}	PLL1: Automatic PLL2: Manual	PLL1 prefers primary, PLL2 selects secondary
X	0	1	1	Automatic	PLL1 and PLL2 prefers primary
X	1	0	X	Manual	PLL1 and/or PLL2 selects primary
X	1	1	X	Manual	PLL1 and/or PLL2 selects secondary

For those applications that require device startup from a crystal on the secondary input and then do a one-time only switchover to the primary input once available and when auto-switch on the PLLs' smart MUXes are enabled, R51.2 can be set to "0" which automatically disables the secondary crystal input path after switchover to the primary input is complete. This removes coupling between the primary and secondary inputs and prevents input crosstalk components from appearing at the outputs. However, if the auto-switch between primary and secondary is desired at any point of normal device operation, R51.2 should be set to "1", PLL should be set to a very low loop bandwidth, and R20, R21 and R22 should be set to 0x0 in order to ensure minimal phase hit once PLLs are relocked after switchover to either primary or secondary inputs. [Figure 44](#) shows flowchart of events triggered when R51.2 is set to "1" or "0".

Figure 44. Flowchart Describing Events when R51.2 is Set to “0” or “1”

9.4.2 Universal Input Buffer (PRI_REF, SEC_REF)

The primary reference can support differential or single ended clocks. The secondary reference can support differential or single ended clocks or crystal. The differential input buffers on both primary and secondary support internal 50-ohm to ground or 100-ohm termination between P and N followed by on-chip AC coupling capacitors to internal self-biased circuitry. Internal biasing is offered before the on-chip AC coupling capacitors when the clock inputs are AC coupled externally and this is enabled by setting R29.0 = “1” (for primary reference) or R29.1 = “1” (for secondary reference). When the clock inputs are DC coupled, the internal biasing before the on-chip AC coupling capacitors is disabled by settings R29.0 = “0” (for primary reference) or R29.1 = “0” (for secondary reference). [Figure 45](#) shows the differential input buffer termination options implemented on both primary and secondary and the switches (SWLVDS, SWHCSL, SWAC) are controlled by R29[5-0]. [Table 2](#) shows the primary and secondary buffer configuration matrix for LVPECL, CML, LVDS, HCSL and LVCMOS inputs.

Figure 45. Differential Input Buffer Termination Options on Primary and Secondary Reference

Figure 55. AC Coupling LMK03328 Inputs with HCSL Signal

9.4.3 Crystal Input Interface (SEC_REF)

The LMK03328 implements an input crystal oscillator circuitry, known as the Pierce oscillator and is shown in [Figure 56](#). It is enabled when R50[7-6], and R29.1 are set to “1”, “0” and “1” respectively. The crystal oscillator circuitry includes programmable on-chip capacitances on each leg of the crystal and a damping resistor intended to minimize overdriven condition of the crystal. The recommended oscillation mode of operation for the input crystal is fundamental mode and the recommended type of circuit for the crystal is parallel resonance with low or high pullability.

A crystal's load capacitance refers to all capacitances in the oscillator feedback loop. It is equal to the amount of capacitance seen between the terminals of the crystal in the circuit. For parallel resonant mode circuits, the correct load capacitance is necessary to ensure the oscillation of the crystal within the expected parameters. The LMK03328 has been characterized with 9-pF parallel resonant crystals with maximum motional resistance of 30-ohm and maximum drive level of 300-uW.

The normalized frequency error of the crystal, due to load capacitance mismatch, can be calculated as:

$$\frac{\Delta f}{f} = \frac{C_S}{2(C_{L,R} + C_0)} - \frac{C_S}{2(C_{L,A} + C_0)}$$

where

- C_S is the motional capacitance of the crystal
- C_0 is the shunt capacitance of the crystal
- $C_{L,R}$ is the rated load capacitance for the crystal
- $C_{L,A}$ is the actual load capacitance in the implemented PCB for the crystal
- Δf is the frequency error of the crystal
- f is the rated frequency of the crystal.

(4)

The first 3 parameters can be obtained from the crystal vendor.

Figure 56. Crystal Input Interface on Secondary Reference

If reducing frequency error of the crystal is of utmost importance, a crystal with low pullability should be used. If frequency margining or frequency spiking is desired, a crystal with high pullability should be used to ensure that the desired frequency offset is added to the nominal oscillation frequency. A total of +/- 50-ppm pulling range is obtained with a crystal whose ratio of shunt capacitance to motional capacitance (C_0/C_1) is no more than 250.

The programmable capacitors on LMK03328 can be tuned from 14-pF to 24-pF in steps of 14-fF using either an analog voltage on GPIO5 in soft pin mode or via I²C in soft pin or hard pin mode. When using crystals with low pullability, preferred method is to program R86.3 = “1”, R86.2 = “0”, and program the appropriate binary code to R104 and R105, in this exact order, that sets the required on-chip load capacitance for least frequency error. GPIO4 pin should be tied to VDD and GPIO5 pin should be floating when device is operating in soft pin mode. [Table 2](#) shows the binary code for on-chip load capacitance on each leg of crystal.

When using crystals with high pullability, same method as above can be repeated for setting a fixed frequency offset to the nominal oscillation frequency according to [Equation 4](#). In case of a closed loop system where the crystal frequency can be dynamically changed based on a control signal, the LMK03328 should operate in soft pin mode and R86.3 should be programmed to “0” and R86.2 should be programmed to “1”. The GPIO5 pin is now configured as an 8-level input with a full-scale range of 0-V to 1.8-V and every 200-mV corresponds to a frequency change, according to [Equation 4](#). There are three possibilities to enable margining feature with GPIO5:

- Programming R86.3 = “0” and R86.2 = “1”. In this case, status of GPIO4 pin is ignored.
- When R86.3 = “0” and R86.2 = “0” is programmed, GPIO4 should be tied to GND. Tying GPIO4 to VDD disables GPIO5 for margining purposes and R94 and R95 determine the on-chip load capacitance for the crystal. If any frequency offset is desired at the output, the appropriate binary code should be programmed to R94 and R95.
- When R86.3 = “1” and R86.2 = “0” is programmed, GPIO4 should be tied to GND. Tying GPIO4 to VDD disables GPIO5 for margining purposes and R104 and R105 determine the on-chip load capacitance for the crystal. If any frequency offset is desired at the output, the appropriate binary code should be programmed to R104 and R105.

There are two possibilities to drive the GPIO5 pin:

- The first method is to achieve the desired voltage between 0V to 1.8V according to [Analog Input Characteristics \(GPIO\[5\]\)](#).
- The second method is using a low-pass filtered PWM signal to drive the 8-level GPIO5 pin as shown in [Figure 57](#). The PWM signal could be generated from the frequency difference between a highly stable TCXO and the output of LMK03328 that is provided as a feedback into the GPIO5 pin and used to adjust the on-chip load capacitance on the crystal input in order to reduce frequency errors from the crystal. This is a quick alternative that produces a frequency error at the LMK03328's output and could be acceptable to any application when compared to a full-characterization with a chosen crystal to understand the exact load pulling required to minimize frequency error at the LMK03328's output. More details on frequency margining are provided in the “Application Information” section.

Figure 57. Crystal Load Capacitance Compensation using PWM Signal

The incremental load capacitance for each step should be programmed to R88, R89, R90, R91, R92, R93, R94, R95, R96, R97, R98, R99, R100, R101, R102, and R103 according to the chosen crystal's trim sensitivity specifications. The least-significant bit programmed to any of the XO offset register corresponds to a load capacitance delta of about 0.02-pF on the crystal input pins.

Good layout practices are fundamental to the correct operation and reliability of the oscillator. It is critical to locate the crystal components very close to the SECREF_P and SECREF_N pins to minimize routing distances. Long traces in the oscillator circuit are a very common source of problems. Don't route other signals across the oscillator circuit, and make sure power and high-frequency traces are routed as far away as possible to avoid crosstalk and noise coupling. If drive level of the crystal should be reduced, a damping resistor (less than 500-ohm) should be accommodated in the layout between the crystal leg and SECREF_P pin. Vias in the oscillator circuit are recommended primarily for connections to the ground plane. Don't share ground connections; instead, make a separate connection to ground for each component that requires grounding. If possible, place multiple vias in parallel for each connection to the ground plane. The layout must be designed to minimize stray capacitance across the crystal to less than 2-pF total under all circumstances to ensure proper crystal oscillation.

9.4.4 Reference Doubler

The primary and secondary references each have a frequency doubler that can be enabled by programming R57.4 = "1" for the primary reference and R72.4 = "1" for the secondary reference. Enabling the doubler allows a higher comparison frequency for the PLL and would result in a 3-dB reduction in the in-band phase noise of the LMK03328's outputs. However, enabling the doubler poses the requirement of less than 0.5% duty cycle distortion of its reference input to minimize high spurious signals in the LMK03328's outputs. If the reference input duty cycle is requirement is not met, each PLL's higher order loop filter components (R3 and C3) can be utilized to suppress the reference input spurs.

9.4.5 Reference Divider (R)

The reference (R) divider is a continuous 3-b counter that is present on the primary reference before the smart input MUX of each PLL. The output of the R divider sets the input frequency for the smart input MUX and the auto switch capability of the smart input MUX can then be employed as long as the secondary input frequency is no more than 2000-ppm different from the output of the R divider, which is programmed in R52 for PLL1 and R54 for PLL2.

9.4.6 Input Divider (M)

The input (M) divider is a continuous 5-b counter that is present after the smart input MUX of each PLL. The output of the M divider sets the PFD frequency to the PLL and should be in the range of 1-MHz to 150-MHz. The M divider is programmed in R53 for PLL1 and R55 for PLL2.

9.4.7 Feedback Divider (N)

The N divider of each PLL includes fractional compensation and can achieve any fractional denominator (DEN) from 1 to 4,194,303. The integer portion, INT, is the whole part of the N divider value and the fractional portion, NUM / DEN, is the remaining fraction. N, NUM, and DEN are programmed in R58, R59, R60, R61, R62, R63, R64, and R65 for PLL1 and in R73, R74, R75, R76, R77, R78, R79, and R80 for PLL2. The total programmed N divider value, N, is determined by: $N = INT + NUM / DEN$. The output of the N divider sets the PFD frequency to the PLL and should be in the range of 1-MHz to 150-MHz.

9.4.8 Phase Frequency Detector (PFD)

The PFD of each PLL takes inputs from the input divider output and the feedback divider output and produces an output that is dependent on the phase and frequency difference between the two inputs. The allowable range of frequencies at the inputs of the PFD is from 1-MHz to 150-MHz.

9.4.9 Charge Pump

Each PLL has charge pump slices of 0.4-mA, 0.8-mA, 1.6-mA, or 6.4-mA. These slices can be selected in the following combinations to vary the charge pump current from 0.4-mA to 6.4-mA by programming R57[3-0] for PLL1 and R72[3-0] for PLL2.

9.4.10 Loop Filter

Each PLL supports programmable loop bandwidth from 200Hz to 1-MHz. The loop filter components, R2, C1, R3, C3, can be configured by programming R67, R68, R69 and R70 respectively for PLL1 and R82, R83, R84 and R85 respectively for PLL2. C2 for each PLL is an external component that is added on the LF1 or LF2 pins. When PLL1 and/or PLL2 are configured in the fractional mode, R69.0 and/or R84.0 should be set to "1" respectively and R118[2-0] and/or R132[2-0] should each be set to "111" respectively. When PLL1 and/or PLL2 are configured in the integer mode, R69.0 and/or R84.0 should be set to "0" respectively and R118[2-0] and/or R132[2-0] should each be set to "011" for second-order or "111" for third-order respectively. When the PLL1 and/or PLL2's loop bandwidth is desired to be set to 200-Hz, R120.0 and/or R134.0 should be set to "0" respectively. Figure 58 shows the loop filter structure of either PLL.

It is important to set the PLL to best possible bandwidth to minimize output jitter. A high bandwidth (≥ 100 -kHz) provides best input signal tracking and is therefore desired with a clean input reference (clock generator mode). A low bandwidth (≤ 1 -kHz) is desired if the input signal quality is unknown (jitter cleaner mode). TI provides the WEBENCH Clock Architect that makes it easy to select the right loop filter components.

Figure 58. Loop Filter Structure of PLL1 and PLL2

9.4.11 VCO Calibration

The LMK03328's PLLs each include an LC VCO that is designed using high-Q monolithic inductors to oscillate between 4.8-GHz and 5.4-GHz and has low phase noise characteristics. Each VCO must be calibrated to ensure that the clock outputs deliver optimal phase noise performance. Fundamentally, a VCO calibration establishes an optimal operating point within the tuning range of the VCO. While transparent to the user, the LMK03328 and the host system perform the following steps comprising a VCO calibration sequence:

1. **Normal Operation** - When the LMK03328 is in normal (operational) mode, the state of the power down pin (PDN) is high.
2. **Entering the reset state** - If the user wishes to initialize the selected pin mode default settings (from ROM, EEPROM, or register default) and initiate a VCO calibration sequence, then the host system must place the device in reset via the PDN pin, or via software reset (R12.7) through I²C, or by removing and restoring device power. Pulling the PDN pin low or setting R12.7 = "0" places the device in the reset state.
3. **Exiting the reset state** - The device calibrates the VCO either by exiting the device reset state or through the device reset command initiated via the host interface. Exiting the reset state occurs automatically after

power is applied and/or the system restores the state of the PDN or R12.7 from the low to high state. Exiting the reset state using the PDN pin causes the selected pin mode defaults to be loaded/reloaded into the device register bank. Invoking software reset via R12.7 does not re-initialize the registers; rather, the device retains settings related to the current clock frequency plan. Using this method allows for a VCO calibration for a frequency plan other than the default state (i.e. the device calibrates the VCO based on the settings current register settings). The nominal state of this bit is high. Writing this bit to a low state and then returning it to the high state invokes a device reset without restoring the pin mode.

4. **Device stabilization** – After exiting the reset state as described in Step 3, the device monitors internal voltages and starts a reset timer. Only after internal voltages are at the correct level and the reset time has expired will the device initiate a VCO calibration. This ensures that the device power supplies and reference inputs have stabilized prior to calibrating the VCO.
5. **VCO Calibration** - The LMK03328 calibrates the VCO. During the calibration routine, the device mutes output channels configured with their respective auto-mute control enabled, so that they generate no spurious clock signals. After a successful calibration routine, the PLL will lock the VCO to the selected reference input.

9.4.12 Fractional Circuitry

The delta-sigma modulator is a key component of the fractional circuitry and is involved in noise shaping for better phase noise and spurs in the band of interest. The order of the delta sigma modulator is selectable from integer mode to third order and can be programmed in R66[1-0] for PLL1 and in R81[1-0] for PLL2. There are also several dithering modes that are also programmed in R66[3-2] for PLL1 and in R81[3-2] for PLL2.

9.4.12.1 Programmable Dithering Levels

If used appropriately, dithering may be used to reduce sub-fractional spurs, but if used inappropriately, it can actually create spurs and increase phase noise. [Table 3](#) provides guidelines for the use of dithering based on the fractional denominator, after the fraction is reduced to lowest terms.

Table 3. Dithering Recommendations

FRACTION	RECOMMENDATION	COMMENTS
Fractional Numerator = 0	Disable Dithering	This is often the worst case for spurs, and can actually be turned into the best case by disabling dithering. Performance is then similar to integer mode.
Equivalent Denominator < 20	Disable Dithering	These fractions are not well randomized and dithering will likely create phase noise and spurs.
Equivalent denominator is not divisible by 2 or 3	Disable Dithering	There will be no sub-fractional spurs, so dithering is likely not to be very effective.
Equivalent denominator > 200 and is divisible by 2 or 3	Consider Dithering	Dithering may help reduce the sub-fractional spurs, but understand it may degrade the PLL phase noise.

9.4.12.2 Programmable Delta Sigma Modulator Order

The programmable fractional modulator order gives the opportunity to better optimize phase noise and spurs. Theoretically, higher order modulators push out phase noise to farther offsets, as described in [Table 4](#).

Table 4. Delta Sigma Modulator Order Recommendations

ORDER	APPLICATIONS
Integer Mode (Order = 0)	If the fractional numerator is zero, it is best to run the PLL in integer mode to minimize phase noise and spurs.
First Order Modulator	When the equivalent fractional denominator is 6 or less, the first order modulator theoretically has lower phase noise and spurs, so it always makes sense in these situations. When the fractional denominator is between 6 and about 20, consider using the first order modulator because the spurs might be far enough outside the loop bandwidth that they will be filtered. The first order modulator also does not create any sub-fractional spurs or phase noise.
Second and Third Order Modulator	The choice between 2nd and 3rd order modulator tends to be a little more application specific. If the fractional denominator is not divisible by 3, then the second and third order modulators will have spurs in the same offsets, so the third is generally better for spurs. However, if stronger levels of dithering is used, the third order modulator will create more close-in phase noise than the second order modulator.

Figure 59 and Figure 60 give an idea of the theoretical impact of the delta sigma modulator order on the shaping of the phase noise and spurs. In terms of phase noise, this is what one would theoretically expect if strong dithering was used for a well-randomized fraction. Dithering can be set to different levels or even disabled and the noise can be eliminated. In terms of spurs, they can change based on fraction, but they will theoretically be pushed out to higher phase detector frequencies. However, one must be aware that these are just THEORETICAL graphs and for offsets that are less than 5% of the phase detector frequency, other factors can impact the noise and spurs. In Figure 59, the curves all cross at 1/6th of the phase detector frequency and that this transfer function peaks at half of the phase detector frequency, which is assumed to be well outside the loop bandwidth. Figure 60 shows the impact of the phase detector frequency on the modulator noise.

Figure 59. Theoretical Delta Sigma Noise Shaping for a 100-MHz Phase Detector Frequency

Figure 60. Theoretical Delta Sigma Noise Shaping for 3rd Order Modulator

9.4.13 Post Divider

Each PLL has a post divider that supports divide-by 2, 3, 4, 5, 6, 7, 8 from the VCO frequency and distributed to the output section by programming R56[4-2] for PLL1 and R71[4-2] for PLL2.

9.4.14 High-Speed Output MUX

The output section is made up of six high-speed output MUX's. The first two MUX's are able to each select between the divided PLL1 and PLL2 clocks by programming R31.7 and R34.7. One MUX distributes to outputs 0, 1 and the other MUX distributes to outputs 2, 3. The remaining four output MUX's are able to each select between primary reference, secondary reference or the divided PLL1 or PLL2 clocks by programming R37[7-6], R39[7-6], R41[7-6], and R43[7-6]. Each of the four MUX's distributes individually to outputs 4, 5, 6, 7. When reference doubler is enabled and any output MUX selects that reference input, the output frequency will be the same as the reference frequency (non-doubled) but the output phase could be the same or complementary of the reference input.

9.4.15 High-Speed Output Divider

There are six high-speed output dividers and each supports divide values of 1 to 256. Outputs 0 and 1 share an output divider, as well as outputs 2 and 3. Outputs 4, 5, 6, 7 have their own individual output dividers. The divide values are programmed in R33, R36, R38, R40, R42, and R44. These output dividers also support coarse frequency margining for all output divide values greater than 8 and can be enabled on any output channel by setting the appropriate bit in R24 to a "1". In such a use case, a dynamic change in the output divider value via I²C ensures that there are no glitches at the output irrespective of when the change is initiated. Depending on the VCO frequency and output divide values, as low as a 5% change can be initiated in the output frequency. An example case of coarse frequency margining on an output is shown in Figure 61.

Figure 61. Simplified Diagram for Coarse Frequency Margining

9.4.16 High-Speed Clock Outputs

Each output can be configured as AC-LVPECL, AC-LVDS, AC-CML, HCSL or LVCMOS by programming R31, R32, R34, R35, R37, R39, R41, and R43. Each output has the option to be muted or not, in case the source from which it is derived becomes invalid, by programming R22. An invalid source could be a primary or secondary reference that is no longer present or any PLL that is unlocked. When outputs are to be muted, their states can be selected by programming R20 and R21. Outputs 0 and 1 share an output supply (VDDO_01), as well as

outputs 2 and 3 (VDDO_23). Outputs 4, 5, 6, 7 have individual output supplies (VDDO_4, VDDO_5, VDDO_6, VDDO_7). Each output supply can be independently set to 1.8-V, 2.5-V or 3.3-V. When a particular output is desired to be disabled, the bits [5:0] in the corresponding output control register (R31, R32, R34, R35, R37, R39, R41 or R43) should be set to "000000". If any of outputs 4, 5, 6, and 7 and their output dividers are disabled; their corresponding supplies can be connected to GND.

The AC-LVDS, AC-CML, and AC-LVPECL output structure is given in Figure 62 where the tail currents can be programmed to either 4-mA, 6-mA, or 8-mA to generate output voltage swings that are compatible with LVDS, CML or LVPECL respectively. Since this output structure is GND referenced, the output supplies can be operated from 1.8-V, 2.5-V or 3.3-V and offer lower power dissipation compared to traditional LVDS, CML, or LVPECL structures without any impact on jitter performance or other AC or DC specifications. Interfacing to LVDS, CML or LVPECL receivers are done with just an external AC-coupling capacitor for each output. No source termination is needed since the on-chip termination is automatically enabled when selecting AC-LVDS, AC-CML, or AC-LVPECL for good impedance matching to 50-ohm interconnects.

Figure 62. Structure of AC-LVDS, AC-CML, and AC-LVPECL Output Stage

The HCSL output structure is open drain and can be direct coupled or AC coupled to HCSL receivers with appropriate termination scheme. This output structure supports either on-chip 50-ohm termination or off-chip 50-ohm termination. The on-chip 50-ohm termination is provided primarily for convenience when driving short traces. In the case of driving long traces possibly through a connector, the on-chip termination should be disabled and a 50-ohm to GND termination at the receiver should be implemented. The output supplies can be operated from 1.8-V, 2.5-V or 3.3-V without any impact on jitter performance or other AC or DC specifications.

The LVCMOS outputs on each side (P and N) can be configured individually to be complementary or in-phase or can be turned off (high output impedance). The output supplies need to be operated from 1.8-V only. In case 3.3-V LVCMOS outputs are needed, STATUS1 and/or STATUS0 can be configured as 3.3-V LVCMOS outputs.

The following figures show recommendations for interfacing between LMK03328's high-speed clock outputs and LVCMOS, LVPECL, LVDS, CML, and HCSL receivers respectively.

NOTE

If 1.8-V LVCMOS signal from the high-speed clock outputs are desired to be interfaced with a 3.3-V LVCMOS receiver, a level-shifter like LSF0101 should be used to convert the 1.8-V LVCMOS signal to a 3.3-V LVCMOS signal.

Figure 63. Interfacing LMK03328's 1.8-V LVCMOS Output with 1.8-V LVCMOS Receiver

Figure 67. Interfacing LMK03328's AC-CML Output with CML Receiver

Figure 68. Interfacing LMK03328's Output with HCSL Receiver

9.4.17 Output Synchronization

All output dividers and PLL post dividers can be synchronized using the active-low SYNCN signal. This signal can come from the GPIO0 pin (in soft pin mode only) or from R12.6. The most common way to execute the output synchronization is to toggle the GPIO0 pin. When R56.1 and/or R71.1 are set to “1”, to enable synchronization of outputs that are derived from PLL1 and/or PLL2, and GPIO0 pin is asserted ($V_{GPIO0} \leq V_{IL}$), the corresponding output driver(s) are muted and divider is reset.

NOTE

Output-to-output skew specification can only be assured when PLL post divider is greater than 2 and after an output synchronization event.

The latency to reset VCO divider is a sum of

1. 2 to 3 negative edge of output clock cycles of the largest divided value + “x” nano seconds of asynchronous delay + 2 to 3 VCO clock cycle.
2. If SYNCN happens after rising but before negative edge, sync delay is less 3 clock cycle and closer to 2 clock cycle.
3. The latency is deterministic and its variation is no more than 1 VCO clock cycle and an example scenario is illustrated in [Figure 62](#).

Table 5. Output Channel Synchronization

GPIO0 / R12.6	Output Divider and Driver State
0	Output driver(s) is tri-stated and divider is reset
1	Normal output driver/divider operation as configured

Minimum SYNC pulse width = 3 negative clock edge of slowest output clock cycle + “x” nano second of prop delay + 3 VCO clock cycle. The synchronization feature is particularly helpful in systems with multiple LMK03328 devices. If SYNCN is released simultaneously for all devices, the total remaining output delay variation is ± 1 VCO clock cycles for all devices configured to identical output mux settings. Output enable/disable events are synchronous to minimize glitch/runt pulses. In Soft Pin Mode, the SYNCN control can also be used to disable any outputs to prevent output clocks from being distributed to down-stream devices, such as DSPs or FPGAs, until they are configured and ready to accept the incoming clock.

Figure 69. SYNCN to Output Delay Variation

9.4.18 Status Outputs

The device vitals such as input signal quality, smart mux input selection, PLL1 and PLL2 loss of lock can be monitored by reading device registers or by monitoring the status pins, STATUS1 and STATUS0. R27 and R28 allow customizing which of the vitals are mapped out to these two pins. Table 5 lists the events that can be mapped to each status pin and which can also be read in the register space. The polarity of the events mapped to the status pins can be selected by programming R15.

A logic-high interrupt output (INTR) can also be selected on either status pins to indicate interrupt status from any of the device vitals listed in R16. In order to use this feature, R17.0 should be set to “1” and the interrupts listed in R16 can be combined in an AND or OR functionality by programming R17.1. If interrupts stemming from particular device vitals are to be ignored, the appropriate bits in R14 should be programmed as needed. The contents of R16 can be read back at any time irrespective of whether the INTR function is chosen in either status pins as long as R17.0 = “1” and the contents of R16 are self-cleared once the readback is complete. There also exists a “real-time” interrupt register, R13, which indicate interrupt status from the device vitals irrespective of the state of R17.0. The contents of R13 can be also read back at any time and are self-cleared once the readback is complete.

9.4.18.1 Loss of Reference

The primary and secondary references can be monitored for their input signal quality and appropriate register bits and status outputs, if enabled, are flagged if a “loss of signal” event is encountered. For differential inputs, a “loss of signal” event occurs when the differential input swing is lower than the threshold as programmed in R25[3-2] for secondary reference and in R25[1-0] for primary reference. For LVCMOS inputs, a “loss of signal” event can be triggered based on either a minimum threshold, programmed in R25[3-2] for secondary reference and in R25[1-0] for primary reference, or a minimum slew rate of 0.3-V/ns, rising edge or falling edge or both being monitored based on selections programmed in R25[7-6] for secondary reference and in R25[5-4] for primary reference.

9.4.18.2 Loss of Lock

Each PLL’s loss of lock detection circuit is a digital circuit that detects any frequency error, even a single cycle slip. The PLL unlock is detected when a certain number of cycle slips have been exceeded, at which point the counter is reset. If the loss of lock is intended to toggle a system reset, an RC filter on the status output, which is programmed to indicate loss of lock, is recommended to avoid rare cycle slips from triggering an entire system reset.

Table 6. Device Vitals Selection Matrix for STATUS[1:0]

Number	Signal
0	PRIREF Loss of Signal (LOS)
1	SECREF Loss of Signal (LOS)
2	PLL1 Loss of Lock (LOL)
3	PLL1 R Divider, divided by 2 (when R Divider is not bypassed)
4	PLL1 N Divider, divided by 2

Table 6. Device Vitals Selection Matrix for STATUS[1:0] (continued)

Number	Signal
5	PLL2 Loss of Lock (LOL)
6	PLL2 R Divider, divided by 2 (when R Divider is not bypassed)
7	PLL2 N Divider, divided by 2
8	PLL1 VCO Calibration Active (CAL)
9	PLL2 VCO Calibration Active (CAL)
10	Interrupt (INTR)
11	PLL1 M Divider, divided by 2 (when M Divider is not bypassed)
12	PLL2 M Divider, divided by 2 (when M Divider is not bypassed)
13	EEPROM Active
14	PLL1 Secondary to Primary Switch in Automatic Mode
15	PLL2 Secondary to Primary Switch in Automatic Mode

When the status pins are programmed as 3.3-V LVCMOS PLL clock outputs with fast output rise/fall time setting, they support up to 200-MHz operation and each output can independently be programmed to different frequencies. Each output has the option to be muted or not, in case the PLL from which it is derived loses lock, by programming R23 and when muted, the output is held at a static state depending on the programmed output type/polarity. In a loss-of-lock event. In order to reduce coupling onto the high-speed outputs, the output rise/fall time can be modified in R49 to support slower slew rates.

NOTE

When either status pin is set as a 3.3-V LVCMOS output, there is fairly significant mixing of these output frequencies into the high-speed outputs, especially outputs 4, 5, 6, 7. If 3.3-V LVCMOS outputs are desired, proper care should be taken during frequency planning with the LMK03328 to ensure that the outputs, required with low jitter, are selected from either output 0, 1, 2, or 3. For best jitter performance, it is recommended to use both status pins to generate complementary 3.3-V LVCMOS outputs at any time.

9.5 Interface and Control

The host (DSP, Microcontroller, FPGA, etc) configures and monitors the LMK03328 via the I²C port. The host reads and writes to a collection of control/status bits called the register map. The device blocks can be controlled and monitored via a specific grouping of bits located within the register file. The host controls and monitors certain device-wide critical parameters directly via register control/status bits. In the absence of the host, the LMK03328 can be configured to operate in pin-mode either from its on-chip ROM or EEPROM depending on the state of HW_SW_CTRL pin. The EEPROM or ROM arrays are automatically copied to the device registers upon powerup. The user has the flexibility to re-write the contents of EEPROM from the SRAM up to a 100 times but the contents of ROM cannot be re-written.

Within the device registers, there are certain bits that have read/write access. Other bits are read-only (an attempt to write to a read only bit will not change the state of the bit). Certain device registers and bits are reserved meaning that they must not be changed from their default reset state. [Figure 70](#) shows interface and control blocks within LMK03328 and the arrows refer to read access from and write access to the different embedded memories (ROM, EEPROM, SRAM).

Interface and Control (continued)

Figure 70. LMK03328 Interface and Control Block

Interface and Control (continued)

9.5.1 I²C Serial Interface

The I²C port on the LMK03328 works as a slave device and supports both the 100-kHz standard mode and 400-kHz fast mode operations. Fast mode imposes a glitch tolerance requirement on the control signals. Therefore, the input receivers ignore pulses of less than 50-ns duration. The I²C timing is given in Table 7.22. The timing diagram is given in Figure 71.

Figure 71. I²C Timing Diagram

In an I²C bus system, the LMK03328 acts as a slave device and is connected to the serial bus (data bus SDA and clock bus SCL). These are accessed via a 7-bit slave address transmitted as part of an I²C packet. Only the device with a matching slave address responds to subsequent I²C commands. In soft pin mode, the LMK03328 allows up to three unique slave devices to occupy the I²C bus based on the pin strapping of GPIO1 (tied to VDD_DIG, GND or V_{IM}). The device slave address is 10101xx (the two LSBs are determined by the GPIO1 pin).

NOTE

The first I²C transaction, after power cycling LMK03328, should be ignored.

During the data transfer through the I²C interface, one clock pulse is generated for each data bit transferred. The data on the SDA line must be stable during the high period of the clock. The high or low state of the data line can change only when the clock signal on the SCL line is low. The start data transfer condition is characterized by a high-to-low transition on the SDA line while SCL is high. The stop data transfer condition is characterized by a low-to-high transition on the SDA line while SCL is high. The start and stop conditions are always initiated by the master. Every byte on the SDA line must be eight bits long. Each byte must be followed by an acknowledge bit and bytes are sent MSB first. The I²C register structure of the LMK03328 is shown in Figure 72.

Figure 72. I²C Register Structure

The acknowledge bit (A) or non-acknowledge bit (A') is the 9th bit attached to any 8-bit data byte and is always generated by the receiver to inform the transmitter that the byte has been received (when A = 0) or not (when A' = 0). A = 0 is done by pulling the SDA line low during the 9th clock pulse and A' = 0 is done by leaving the SDA line high during the 9th clock pulse.

Interface and Control (continued)

The I²C master initiates the data transfer by asserting a start condition which initiates a response from all slave devices connected to the serial bus. Based on the 8-bit address byte sent by the master over the SDA line (consisting of the 7-bit slave address (MSB first) and an R/W' bit), the device whose address corresponds to the transmitted address responds by sending an acknowledge bit. All other devices on the bus remain idle while the selected device waits for data transfer with the master.

After the data transfer has occurred, stop conditions are established. In write mode, the master asserts a stop condition to end data transfer during the 10th clock pulse following the acknowledge bit for the last data byte from the slave. In read mode, the master receives the last data byte from the slave but does not pull SDA low during the 9th clock pulse. This is known as a non-acknowledge bit. By receiving the non-acknowledge bit, the slave knows the data transfer is finished and enters the idle mode. The master then takes the data line low during the low period before the 10th clock pulse, and high during the 10th clock pulse to assert a stop condition. A generic transaction is shown in [Figure 73](#).

Figure 73. Generic Programming Sequence

The LMK03328 I²C interface supports “Block Register Write/Read”, “Read/Write SRAM”, and “Read/Write EEPROM” operations. For “Block Register Write/Read” operations, the I²C master can individually access addressed registers that are made of an 8-bit data byte. The offset of the indexed register is encoded in the register address, as described in [Table 7](#) below.

Table 7. Slave Address Byte

DEVICE	A6	A5	A4	A3	A2	GPIO1	R/W
LMK03328	1	0	1	0	1	00, 01 or 10	1/0

9.5.2 Block Register Write

The I²C “Block Register Write” transaction is illustrated in [Figure 74](#) and consists of the following sequence.

1. Master issues a Start Condition.
2. Master writes the 7-bit Slave Address following by a Write bit.
3. Master writes the 8-bit Register address as the CommandCode of the programming sequence.
4. Master writes one or more data bytes each of which should be acknowledged by the slave. The slave increments the internal register address after each byte.
5. Master issues a Stop Condition to terminate the transaction.

Figure 74. “Block Register Write” Programming Sequence

9.5.3 Block Register Read

The I²C “Block Register Read” transaction is illustrated in [Figure 75](#) and consists of the following sequence.

1. Master issues a Start Condition.
2. Master writes the 7-bit Slave Address followed by a Write bit.
3. Master writes the 8-bit Register address as the CommandCode of the programming sequence.
4. Master issues a Repeated Start Condition.
5. Master writes the 7-bit Slave Address following by a Read bit.
6. Slave returns one or more data bytes as long as the Master continues to acknowledge them. The slave increments the internal register address after each byte.
7. Master issues a Stop Condition to terminate the transaction.

Figure 75. “Block Register Read” Programming Sequence

9.5.4 Write SRAM

The on-chip SRAM is a volatile, shadow memory array used to temporarily store register data, and is intended only for programming the non-volatile EEPROM array with one or more device start-up configuration settings (pages). The SRAM has the identical data format as the EEPROM map. The register configuration data can be transferred to the SRAM array through special memory access registers in the register map.

The SRAM is made up of a base memory array and 6 pages of identical memory arrays. In order to successfully program the SRAM, the complete base array and at least one page should be written.

The following details the programming sequence to transfer the device registers into the appropriate SRAM page.

1. Program the device registers to match a desired setting.
2. Write R145[3:0] with a valid SRAM page (0 to 5) to commit the current register data.
3. Write a “1” to R137.6. This ensures that the device registers are copied to the desired SRAM page.
4. If another device setting is desired to be written to a different SRAM page, repeat steps 1-3 and select an unused SRAM page.

The SRAM can also be written with particular values according to the following programming sequence.

1. Write the most significant 8th bit of the SRAM address in R139.0 and write the least significant 8 bits in R140.
2. Write the desired data byte in R142 in the same I²C transaction and this data byte will be written to the address specified in the step above. Any additional access that is part of the same transaction will cause the SRAM address to be incremented and a write will take place to the next SRAM address. Access to SRAM will terminate at the end of current I²C transaction.

NOTE

It is possible to increment SRAM address incorrectly when 2 successive accesses are made to R140.

9.5.5 Write EEPROM

The on-chip EEPROM is a non-volatile memory array used to permanently store register data for one or more device start-up configuration settings (pages), which can be selected to initialize registers upon power-up or POR. There are a total of 6 independent EEPROM pages of which each page is selected by the 3-level GPIO[3:2] pins, and each page is comprised of bits shown in the [EEPROM Map](#). The transfer must first happen to the corresponding SRAM page and then to the EEPROM page. During “EEPROM write”, R137.2 is a “1” and the EEPROM contents cannot be accessed. The following details the programming sequence to transfer the entire contents of SRAM to EEPROM.

1. Make sure the “Write SRAM” procedure ([Write SRAM](#)) was done to commit the register settings to the SRAM page(s) with start-up configurations intended for programming to the EEPROM array.
2. Write “0xEA” to R144. This provides basic protection from inadvertent programming of EEPROM.
3. Write a “1” to R137.0. This programs the entire SRAM contents to EEPROM. Once completed, the contents in R136 will increment by 1. R136 contains the total number of EEPROM programming cycles that are successfully completed.
4. Write “0x00” to R144 to protect against inadvertent programming of EEPROM.

9.5.6 Read SRAM

The contents of the SRAM can be read out, one word at a time, starting with that of the requested address. Following details the programming sequence for an SRAM read by address.

1. Write the most significant 9th bit of the SRAM address in R139.0 and write the least significant 8 bits of the SRAM address in R140.
2. The SRAM data located at the address specified in the step above can be obtained by reading R142 in the same I²C transaction. Any additional access that is part of the same transaction will cause the SRAM address to be incremented and a read will take place of the next SRAM address. Access to SRAM will terminate at the end of current I²C transaction.

NOTE

It is possible to increment SRAM address incorrectly when 2 successive accesses are made to R140.

9.5.7 Read EEPROM

The contents of the EEPROM can be read out, one word at a time, starting with that of the requested address. Following details the programming sequence for an EEPROM read by address.

1. Write the most significant 9th bit of the EEPROM address in R139.0 and write the least significant 8 bits of the EEPROM address in R140.
2. The EEPROM data located at the address specified in the step above can be obtained by reading R141 in the same I²C transaction. Any additional access that is part of the same transaction will cause the EEPROM address to be incremented and a read will take place of the next EEPROM address. Access to EEPROM will terminate at the end of current I²C transaction.

NOTE

It is possible to increment EEPROM address incorrectly when 2 successive accesses are made to R140.

9.5.8 Read ROM

The contents of the ROM can be read out, one word at a time, starting with that of the requested address. Following details the programming sequence of a ROM read by address.

1. Write the most significant 11th, 10th, 9th, and 8th bit of the ROM address in R139[3-0] and write the least significant 8 bits of the ROM address in R140.
2. The ROM data located at the address specified in the step above can be obtained by reading R143 in the same I²C transaction. Any additional access that is part of the same transaction will cause the ROM address to be incremented and a read will take place of the next ROM address. Access to ROM will terminate at the end of current I²C transaction.

9.5.9 Default Device Configurations in EEPROM and ROM

Tables 10-14 show the device default configurations stored in the on-chip EEPROM. Tables 15-19 show the device default configurations stored in the on-chip ROM.

9.6 Register Maps

The register map is shown in the table below. The registers occupy a single unified address space and all registers are accessible at any time. A total of 123 registers are present in the LMK03328.

Name	Addr	Default	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	
VNDRID_BY1	0	0x10	VNDRID[15:8]

9.6.1 VNDRID_BY1 Register; R0

The VNDRID_BY1 and VNDRID_BY0 registers are used to store the unique 16-bit Vendor Identification number assigned to I²C vendors.

Bit #	Field	Type	Reset	EEPROM	Description
[7:0]	VNDRID[15:8]	R	0x10	N	Vendor Identification Number Byte 1. The Vendor Identification Number is a unique 16-bit identification number assigned to I ² C vendors.

9.6.2 VNDRID_BY0 Register; R1

The VNDRID_BY0 register is described in the following table.

Bit #	Field	Type	Reset	EEPROM	Description
[7:0]	VNDRID[7:0]	R	0xB	N	Vendor Identification Number Byte 0.

9.6.3 PRODID Register; R2

The PRODID register is used to identify the LMK03328 device.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PRODID[7:0]	R	0x32	N	Product Identification Number. The Product Identification Number is a unique 8-bit identification number used to identify the LMK03328.

9.6.4 REVID Register; R3

The REVID register is used to identify the LMK03328 mask revision.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	REVID[7:0]	R	0x0	N	Device Revision Number. The Device Revision Number is used to identify the LMK03328 die revision

9.6.5 PARTID_BY3 Register; R4

Each LMK03328 device can be identified by a unique 32-bit number stored in the PARTID_BY3, PARTID_BY2, PARTID_BY1 and PARTID_BY0 registers. These registers are always initialized from on-chip EEPROM.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PRTID[31:24]	R	0x0	Y	Part Identification Number Byte 3. The Part Identification Number is a unique 32-bit number which is used to serialize individual LMK03328 devices. The Part Identification Number is factory programmed and cannot be modified by the user.

9.6.6 PARTID_BY2 Register; R5

The PARTID_BY2 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PRTID[23:16]	R	0x0	Y	Part Identification Number Byte 2.

9.6.7 PARTID_BY1 Register; R6

The PARTID_BY1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PRTID[15:8]	R	0x0	Y	Part Identification Number Byte 1.

9.6.8 PARTID_BY0 Register; R7

The PARTID_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PRTID[7:0]	R	0x0	Y	Part Identification Number Byte 0.

9.6.9 PINMODE_SW Register; R8

The PINMODE_SW register records the device configuration setting. The configuration setting is registered when the reset is deasserted.

Bit #	Field	Type	Reset	NVM	Description
[7]	HW_SW_CTRL_MODE	R	0	N	HW_SW_CTRL Pin Configuration. The HW_SW_CTRL_MODE field reflects the values sampled on the HW_SW_CTRL pin on the most recent device reset.
					HW_SW_CTRL_MODE HW_SW_CTRL
					0 Soft Pin Mode
					1 Hard Pin Mode
[6:4]	GPIO32_SW_MODE[2:0]	R	0x0	N	GPIO32_SW Pin Configuration Mode. The GPIO_SW_MODE field reflects the values sampled on the GPIO[3:2] pins when HW_SW_CTRL is 0 on the most recent device reset. When HW_SW_CTRL is 1 this field reads back 0x0.
					GPIO_SW_MODE GPIO[3] GPIO[2]
					0 0 0
					1 0 Z
					2 0 1
					3 1 0
					4 1 Z
					5 1 1
[3:0]	RSRVD	-	-	N	Reserved.

9.6.10 PINMODE_HW Register; R9

The PINMODE_HW register records the device configuration setting. The configuration setting is registered when the reset is deasserted.

Bit #	Field	Type	Reset	NVM	Description
[7:2]	GPIO_HW_MODE[5:0]	R	0x0	N	GPIO_HW[5:0] Pin Configuration Mode. The GPIO_HW_MODE field reflects the values sampled on pins GPIO[5:0] when HW_SW_CTRL is 1 on the most recent device reset. When HW_SW_CTRL is 0 this field reads back 0x0.
					GPIO_HW_MODE GPIO[5:0]
					0 0b000000
					1 0b000001
					2 0b000010
					
					
					61 0b111101
					62 0b111110
					63 0b111111
[1:0]	RSRVD	-	-	N	Reserved.

9.6.11 SLAVEADR Register; R10

The SLAVEADR register reflects the 7-bit I²C Slave Address value initialized from from on-chip EEPROM.

Bit #	Field	Type	Reset	NVM	Description	
[7:1]	SLAVEADR_GPIO1_SW[7:1]	R	0x84	Y	I ² C Slave Address. This field holds the 7-bit Slave Address used to identify this device during I ² C transactions. When HW_SW_CTRL is 1 the two least significant bits of the address can be configured using GPIO[1] as shown. When HW_SW_CTRL is 0 then the two least significant bits are 00.	
					SLAVEADR_GPIO1_SW[2:1]	GPIO[1]
					00	0
					01	V _{IM}
					11	1
[0]	RSRVD	-	-	N	Reserved.	

9.6.12 EEREV Register; R11

The EEREV register provides EEPROM/ROM image revision record and is initialized from EEPROM or ROM.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	EEREV[7:0]	R	0x0	Y	EEPROM Image Revision ID. EEPROM Image Revision is automatically retrieved from EEPROM and stored in the EEREV register after a reset or after a NVM commit operation.

9.6.13 DEV_CTL Register; R12

The DEV_CTL register holds the control functions described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7]	RESETN_SW	RW	1	N	Software Reset ALL functions (active low). Writing a 0 will cause the device to return to its power-up state apart from the I ² C registers and the configuration controller. The configuration controller is excluded to prevent a re-transfer of EEPROM data to on-chip registers.
[6]	SYNCRN_SW	RW	1	N	Software SYNC Assertion (active low). Writing a 0 to this bit is equivalent to asserting the GPIO0 pin.
[5]	RSRVD	-	-	N	Reserved.
[4]	SYNC_AUTO	RW	1	Y	Automatic Synchronization at startup. When SYNC_AUTO is 1 at device startup a synchronization sequence is initiated automatically after PLL lock has been achieved.
[3]	SYNC_MUTE	RW	1	Y	Synchronization Mute Control. The SYNC_MUTE field determines whether or not the output drivers are muted during a Synchronization event.
					SYNC_MUTE
					0
[2]	AONAFTERLOCK	RW	0	Y	Always On Clock behaviour after Lock. If AONAFTERLOCK is 0 then the system clock is switched from the Always On Clock to the VCO Clock after lock and the Always On Clock oscillator is disabled. If AONAFTERLOCK is 1 then the Always on Clock will remain as the digital system clock regardless of the PLL Lock state.
					1
					Mute all outputs during SYNC
[1]	PLLSTRTMODE	RW	0	Y	PLL Startup Mode. If PLLSTRTMODE is 1 then the calibration sequence for both PLL's is run independently. At startup this means PLL1 and PLL2 will be calibrated in parallel. Additionally if PLL2 is subject to a Software Reset or Powerdown cycle then PLL2 re-calibration will restart regardless of the state of PLL1. If PLLSTRTMODE is 0 then PLL2 is only calibrated after PLL1 has achieved lock or PLL1 is powered down.
[0]	AUTOSTRT	RW	1	Y	Autostart. If AUTOSTRT is set to 1 the device will automatically attempt to achieve lock and enable outputs after a device reset. A device reset can be triggered by the power-on-reset, RESETn pin or by writing to the RESETN_SW bit. If AUTOSTRT is 0 then the device will halt after the configuration phase, a subsequent write to set the AUTOSTRT bit to 1 will trigger the PLL Lock sequence.

9.6.14 INT_LIVE Register; R13

The INT_LIVE register reflects the current status of the interrupt sources, regardless of the state of the INT_EN bit.

Bit #	Field	Type	Reset	NVM	Description
[7]	LOL1	R	0	N	Loss of Lock PLL1.
[6]	LOS1	R	0	N	Loss of Signal PLL1.
[5]	CAL1	R	0	N	Calibration Active PLL1.
[4]	LOL2	R	0	N	Loss of Lock PLL2.
[3]	LOS2	R	0	N	Loss of Signal PLL2.
[2]	CAL2	R	0	N	Calibration Active PLL2.
[1]	SECTOPRI1	R	0	N	Switch from Secondary Reference to Primary Reference in Automatic Mode PLL1.
[0]	SECTOPRI2	R	0	N	Switch from Secondary Reference to Primary Reference in Automatic Mode PLL2.

9.6.15 INT_MASK Register; R14

The INT_MASK register allows masking of the interrupt sources.

Bit #	Field	Type	Reset	NVM	Description
[7]	LOL1_MASK	RW	0	Y	Mask Loss of Lock PLL1. When LOL1_MASK is 1 then the LOL1 interrupt source is masked and will not cause the interrupt signal to be activated.
[6]	LOS1_MASK	RW	0	Y	Mask Loss of Signal PLL1. When LOS1_MASK is 1 then the LOS1 interrupt source is masked and will not cause the interrupt signal to be activated.
[5]	CAL1_MASK	RW	0	Y	Mask Calibration Active PLL1. When CAL1_MASK is 1 then the CAL1 interrupt source is masked and will not cause the interrupt signal to be activated.
[4]	LOL2_MASK	RW	0	Y	Mask Loss of Lock PLL2. When LOL2_MASK is 1 then the LOL2 interrupt source is masked and will not cause the interrupt signal to be activated.
[3]	LOS2_MASK	RW	0	Y	Mask Loss of Signal PLL2. When LOS2_MASK is 1 then the LOS2 interrupt source is masked and will not cause the interrupt signal to be activated.
[2]	CAL2_MASK	RW	0	Y	Mask Calibration Active PLL2. When CAL2_MASK is 1 then the CAL2 interrupt source is masked and will not cause the interrupt signal to be activated.
[1]	SECTOPRI1_MASK	RW	0	Y	Mask Switch from Secondary Reference to Primary Reference PLL1. When SECTOPRI1_MASK is 1 then the SECTOPRI1 interrupt source is masked and will not cause the interrupt signal to be activated.
[0]	SECTOPRI2_MASK	RW	0	Y	Mask Switch from Secondary Reference to Primary Reference PLL2. When SECTOPRI2_MASK is 1 then the SECTOPRI2 interrupt source is masked and will not cause the interrupt signal to be activated.

9.6.16 INT_FLAG_POL Register; R15

The INT_FLAG_POL register controls the signal polarity that sets the Interrupt Flags.

Bit #	Field	Type	Reset	NVM	Description
[7]	LOL1_POL	RW	0	Y	LOL1 Flag Polarity. When LOL1_POL is 1 then a rising edge on LOL1 will set the LOL1_INTR bit of the INTERRUPT_FLAG register. When LOL1_POL is 0 then a falling edge on LOL1 will set the LOL1_INTR bit.
[6]	LOS1_POL	RW	0	Y	LOS1 Flag Polarity. When LOS1_POL is 1 then a rising edge on LOS1 will set the LOS1_INTR bit of the INTERRUPT_FLAG register. When LOS1_POL is 0 then a falling edge on LOS1 will set the LOS1_INTR bit.
[5]	CAL1_POL	RW	0	Y	CAL1 Flag Polarity. When CAL1_POL is 1 then a rising edge on CAL1 will set the CAL1_INTR bit of the INTERRUPT_FLAG register. When CAL1_POL is 0 then a falling edge on CAL1 will set the CAL1_INTR bit.
[4]	LOL2_POL	RW	0	Y	LOL2 Flag Polarity. When LOL2_POL is 1 then a rising edge on LOL2 will set the LOL2_INTR bit of the INTERRUPT_FLAG register. When LOL2_POL is 0 then a falling edge on LOL2 will set the LOL2_INTR bit.
[3]	LOS2_POL	RW	0	Y	LOS2 Flag Polarity. When LOS2_POL is 1 then a rising edge on LOS2 will set the LOS2_INTR bit of the INTERRUPT_FLAG register. When LOS2_POL is 0 then a falling edge on LOS2 will set the LOS2_INTR bit.
[2]	CAL2_POL	RW	0	Y	CAL2 Flag Polarity. When CAL2_POL is 1 then a rising edge on CAL2 will set the CAL2_INTR bit of the INTERRUPT_FLAG register. When CAL2_POL is 0 then a falling edge on CAL2 will set the CAL2_INTR bit.
[1]	SECTOPRI1_POL	RW	0	Y	SECTOPRI1 Flag Polarity. When SECTOPRI1_POL is 1 then a rising edge on SECTOPRI1 will set the SECTOPRI1_INTR bit of the INTERRUPT_FLAG register. When SECTOPRI1_POL is 0 then a falling edge on SECTOPRI1 will set the SECTOPRI1_INTR bit.
[0]	SECTOPRI2_POL	RW	0	Y	SECTOPRI2 Flag Polarity. When SECTOPRI2_POL is 1 then a rising edge on SECTOPRI2 will set the SECTOPRI2_INTR bit of the INTERRUPT_FLAG register. When SECTOPRI2_POL is 0 then a falling edge on SECTOPRI2 will set the SECTOPRI2_INTR bit.

9.6.17 INT_FLAG Register; R16

The INT_FLAG register records rising or falling edges on the interrupt sources. The polarity is controlled by the INT_FLAG_POL register. This register is only updated if the INT_EN register bit is set to 1.

Bit #	Field	Type	Reset	NVM	Description
[7]	LOL1_INTR	R	0	N	LOL1 Interrupt. The LOL1_INTR bit is set when an edge of the correct polarity is detected on the LOL1 interrupt source. The LOL1_INTR bit is cleared by writing a 0.
[6]	LOS1_INTR	R	0	N	LOS1 Interrupt. The LOS1_INTR bit is set when an edge of the correct polarity is detected on the LOS1 interrupt source. The LOS1_INTR bit is cleared by writing a 0.
[5]	CAL1_INTR	R	0	N	CAL1 Interrupt. The CAL1_INTR bit is set when an edge of the correct polarity is detected on the CAL1 interrupt source. The CAL1_INTR bit is cleared by writing a 0.
[4]	LOL2_INTR	R	0	N	LOL2 Interrupt. The LOL2_INTR bit is set when an edge of the correct polarity is detected on the LOL2 interrupt source. The LOL2_INTR bit is cleared by writing a 0.
[3]	LOS2_INTR	R	0	N	LOS2 Interrupt. The LOS2_INTR bit is set when an edge of the correct polarity is detected on the LOS2 interrupt source. The LOS2_INTR bit is cleared by writing a 0.
[2]	CAL2_INTR	R	0	N	CAL2 Interrupt. The CAL2_INTR bit is set when an edge of the correct polarity is detected on the CAL2 interrupt source. The CAL2_INTR bit is cleared by writing a 0.
[1]	SECTOPRI1_INTR	R	0	N	SECTOPRI1 Interrupt. The SECT2PRI1_INTR bit is set when an edge of the correct polarity is detected on the SECTOPRI1 interrupt source. The SECTOPRI1_INTR bit is cleared by writing a 0.
[0]	SECTOPRI2_INTR	R	0	N	SECTOPRI2 Interrupt. The SECTOPRI2_INTR bit is set when an edge of the correct polarity is detected on the SECTOPRI2 interrupt source. The SECTOPRI2_INTR bit is cleared by writing a 0.

9.6.18 INTCTL Register; R17

The INTCTL register allows configuration of the Interrupt operation.

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1]	INT_AND_OR	RW	0	Y	Interrupt AND/OR Combination. If INT_AND_OR is 1 then the interrupts are combined in an AND structure. In which case ALL un-masked interrupt flags must be active in order to generate the interrupt. If INT_AND_OR is 0 then the interrupts are combined in an OR structure. In which case ANY un-masked interrupt flags can generate the interrupt
	INT_AND_OR				Interrupt Function
	0				OR
	1				AND
[0]	INT_EN	RW	0	Y	Interrupt Enable. If INT_EN is 1 then the interrupt circuit is enabled, if INT_EN is 0 the interrupt circuit is disabled. When INT_EN is 0, interrupts cannot be signalled on the STATUS pins and the INT_FLAG registers will not be updated, however the INT_LIVE register will still reflect the current state of the internal interrupt signals.

9.6.19 OSCCTL2 Register; R18

The OSCCTL2 register provides access to input reference status signals

Bit #	Field	Type	Reset	NVM	Description
[7]	RISE_VALID_SE	R	0	N	Secondary Input Rising Valid Indicator from Slew Rate Detector.
[6]	FALL_VALID_SE	R	0	N	Secondary Input Falling Valid Indicator from Slew Rate Detector.
[5]	RISE_VALID_PRI	R	0	N	Primary Input Rising Valid Indicator from Slew Rate Detector.
[4]	FALL_VALID_PRI	R	0	N	Primary Input Falling Valid Indicator from Slew Rate Detector.
[3:0]	RSRVD	-	-	N	Reserved.

9.6.20 STATCTL Register; R19

The STATCTL register provides to STATUS0/1 output driver control signals.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5]	STAT1_SHOOT_THRU_LIMIT	RW	0	Y	STATUS1 Output Shoot Through Current Limit. When STAT1_SHOOT_THRU_LIMIT is 1 then the transient current spikes are minimized, the performance of the STATUS1 output is degraded in this mode.
[4]	STAT0_SHOOT_THRU_LIMIT	RW	0	Y	STATUS0 Output Shoot Through Current Limit. When STAT0_SHOOT_THRU_LIMIT is 1 then the transient current spikes are minimized, the performance of the STATUS0 output is degraded in this mode.
[3:2]	RSRVD	RW	0x0	Y	Reserved.
[1]	STAT1_OPEND	RW	0	Y	STATUS1 Open Drain Enable. When STAT1_OPEND is 1 the STATUS1 output is configured as an open drain output driver.
[0]	STAT0_OPEND	RW	0	Y	STATUS0 Open Drain Enable. When STAT0_OPEND is 1 the STATUS0 output is configured as an open drain output driver.

9.6.21 MUTELVL1 Register; R20

The MUTELVL1 register determines the Output Driver during mute for output drivers 0 to 3.

LMK03328

SNAS668 –AUGUST 2015

www.ti.com

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH3_MUTE_LVL[1:0]	RW	0x1	Y	Channel 3 Output Driver Mute Level. CH3_MUTE_LVL determines the configuration of the CH3 Output Driver during mute as shown in the following table. CH3_MUTE_LVL does not determine whether the CH3 driver is muted or not, instead this is determined by the CH_3_MUTE register bit.
					CH3_MUTE_LVL DIFF MODE CMOS MODE
					0 CH3 Mute Bypass CH3 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[5:4]	CH2_MUTE_LVL[1:0]	RW	0x1	Y	Channel 2 Output Driver Mute Level. CH2_MUTE_LVL determines the configuration of the CH2 Output Driver during mute as shown in the following table. CH2_MUTE_LVL does not determine whether the CH2 driver is muted or not, instead this is determined by the CH_2_MUTE register bit.
					CH2_MUTE_LVL DIFF MODE CMOS MODE
					0 CH2 Mute Bypass CH2 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[3:2]	CH1_MUTE_LVL[1:0]	RW	0x1	Y	Channel 1 Output Driver Mute Level. CH1_MUTE_LVL determines the configuration of the CH1 Output Driver during mute as shown in the following table. CH1_MUTE_LVL does not determine whether the CH1 driver is muted or not, instead this is determined by the CH_1_MUTE register bit.
					CH1_MUTE_LVL DIFF MODE CMOS MODE
					0 CH1 Mute Bypass CH1 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[1:0]	CH0_MUTE_LVL[1:0]	RW	0x1	Y	Channel 0 Output Driver Mute Level. CH0_MUTE_LVL determines the configuration of the CH0 Output Driver during mute as shown in the following table. CH0_MUTE_LVL does not determine whether the CH0 driver is muted or not, instead this is determined by the CH_0_MUTE register bit.
					CH0_MUTE_LVL DIFF MODE CMOS MODE
					0 CH0 Mute Bypass CH0 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low

9.6.22 MUTELVL2 Register; R21

The MUTELVL2 register determines the Output Driver during mute for output drivers 4 to 7.

LMK03328

SNAS668 –AUGUST 2015

www.ti.com

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH7_MUTE_LVL[1:0]	RW	0x1	Y	Channel 7 Output Driver Mute Level. CH7_MUTE_LVL determines the configuration of the CH7 Output Driver during mute as shown in the following table. CH7_MUTE_LVL does not determine whether the CH7 driver is muted or not, instead this is determined by the CH_7_MUTE register bit.
					CH7_MUTE_LVL DIFF MODE CMOS MODE
					0 CH7 Mute Bypass CH7 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[5:4]	CH6_MUTE_LVL[1:0]	RW	0x1	Y	Channel 6 Output Driver Mute Level. CH6_MUTE_LVL determines the configuration of the CH6 Output Driver during mute as shown in the following table. CH6_MUTE_LVL does not determine whether the CH6 driver is muted or not, instead this is determined by the CH_6_MUTE register bit.
					CH6_MUTE_LVL DIFF MODE CMOS MODE
					0 CH6 Mute Bypass CH6 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[3:2]	CH5_MUTE_LVL[1:0]	RW	0x1	Y	Channel 5 Output Driver Mute Level. CH5_MUTE_LVL determines the configuration of the CH5 Output Driver during mute as shown in the following table. CH5_MUTE_LVL does not determine whether the CH5 driver is muted or not, instead this is determined by the CH_5_MUTE register bit.
					CH5_MUTE_LVL DIFF MODE CMOS MODE
					0 CH5 Mute Bypass CH5 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low
[1:0]	CH4_MUTE_LVL[1:0]	RW	0x1	Y	Channel 4 Output Driver Mute Level. CH4_MUTE_LVL determines the configuration of the CH4 Output Driver during mute as shown in the following table. CH4_MUTE_LVL does not determine whether the CH4 driver is muted or not, instead this is determined by the CH_4_MUTE register bit.
					CH4_MUTE_LVL DIFF MODE CMOS MODE
					0 CH4 Mute Bypass CH4 Mute Bypass
					1 Powerdown, output goes to Vcm Out_P Normal Operation, Out_N Force Input Low
					2 Force output High Out_P Force Input Low, Out_N Normal Operation
					3 Force output Low Out_P Force Input Low, Out_N Force Input Low

9.6.23 OUT_MUTE Register; R22

Output Channel Mute Control

Bit #	Field	Type	Reset	NVM	Description
[7]	CH_7_MUTE	RW	1	Y	Channel 7 Mute Control. When CH_7_MUTE is set to 1 Output Channel 7 is automatically disabled when the selected clock source is invalid. When CH_7_MUTE_7 is 0 Channel 7 will continue to operate regardless of the state of the selected clock source.
[6]	CH_6_MUTE	RW	1	Y	Channel 6 Mute Control. When CH_6_MUTE is set to 1 Output Channel 6 is automatically disabled when the selected clock source is invalid. When CH_6_MUTE_6 is 0 Channel 6 will continue to operate regardless of the state of the selected clock source.
[5]	CH_5_MUTE	RW	1	Y	Channel 5 Mute Control. When CH_5_MUTE is set to 1 Output Channel 5 is automatically disabled when the selected clock source is invalid. When CH_5_MUTE_5 is 0 Channel 5 will continue to operate regardless of the state of the selected clock source.
[4]	CH_4_MUTE	RW	1	Y	Channel 4 Mute Control. When CH_4_MUTE is set to 1 Output Channel 4 is automatically disabled when the selected clock source is invalid. When CH_4_MUTE_4 is 0 Channel 4 will continue to operate regardless of the state of the selected clock source.
[3]	CH_3_MUTE	RW	1	Y	Channel 3 Mute Control. When CH_3_MUTE is set to 1 Output Channel 3 is automatically disabled when the selected clock source is invalid. When CH_3_MUTE is 0 Channel 3 will continue to operate regardless of the state of the selected clock source.
[2]	CH_2_MUTE	RW	1	Y	Channel 2 Mute Control. When CH_2_MUTE is set to 1 Output Channel 2 is automatically disabled when the selected clock source is invalid. When CH_2_MUTE is 0 Channel 2 will continue to operate regardless of the state of the selected clock source.
[1]	CH_1_MUTE	RW	1	Y	Channel 1 Mute Control. When CH_1_MUTE is set to 1 Output Channel 1 is automatically disabled when the selected clock source is invalid. When CH_1_MUTE is 0 Channel 1 will continue to operate regardless of the state of the selected clock source.
[0]	CH_0_MUTE	RW	1	Y	Channel 0 Mute Control. When CH_0_MUTE is set to 1 Output Channel 0 is automatically disabled when the selected clock source is invalid. When CH_0_MUTE is 0 Channel 0 will continue to operate regardless of the state of the selected clock source.

9.6.24 STATUS_MUTE Register; R23

Status CMOS Output Mute Control

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1]	STATUS1_MUTE	RW	1	Y	STATUS 1 Mute Control. When the STATUS1 output is configured to provide a CMOS Clock and the STATUS1_MUTE bit is set to 1 then the STATUS1 Output is automatically disabled when the selected clock source is invalid. When STATUS1_MUTE is 0 the STATUS1 Output will continue to operate regardless of the state of the selected clock source. If the STATUS1 output is not configured to provide a Clock then it will continue to operate regardless of the STATUS1_MUTE bit value.
[0]	STATUS0_MUTE	RW	0	Y	STATUS 0 Mute Control. When the STATUS0 output is configured to provide a CMOS Clock and the STATUS0_MUTE bit is set to 1 then the STATUS0 Output is automatically disabled when the selected clock source is invalid. When STATUS0_MUTE is 0 the STATUS0 Output will continue to operate regardless of the state of the selected clock source. If the STATUS0 output is not configured to provide a Clock then it will continue to operate regardless of the STATUS0_MUTE bit value.

9.6.25 DYN_DLY Register; R24

Output Divider Dynamic Delay Control

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5]	DIV_7_DYN_DLY	RW	0	Y	Channel 7 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8
[4]	DIV_6_DYN_DLY	RW	0	Y	Channel 6 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8
[3]	DIV_5_DYN_DLY	RW	0	Y	Channel 5 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8
[2]	DIV_4_DYN_DLY	RW	0	Y	Channel 4 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8
[1]	DIV_23_DYN_DLY	RW	0	Y	Channel 23 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8
[0]	DIV_01_DYN_DLY	RW	0	Y	Channel 01 Divider Dynamic Delay Control. Enables coarse frequency margining for divide value > 8

9.6.26 REFDECTL Register; R25

The REFDECTL register provides control over input reference clock detect features.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	DETECT_MODE_SEC[1:0]	RW	0x1	Y	Secondary Input Energy Detector Mode Control. The DETECT_MODE_SEC field determines the method for Energy Detection on a single-ended signal on the Secondary Input as follows.
					DETECT_MODE_SEC Energy Detection Method
					0 Rising Slew Rate Detector
					1 Rising and Falling Slew Rate Detector
					2 Falling Slew Rate Detector
					3 VIH/VIL Level Detector
[5:4]	DETECT_MODE_PRI[1:0]	RW	0x1	Y	Primary Input Energy Detector Mode Control. The DETECT_MODE_PRI field determines the method for Energy Detection on a single-ended signal on the Primary Input as follows.
					DETECT_MODE_PRI Energy Detection Method
					0 Rising Slew Rate Detector
					1 Rising and Falling Slew Rate Detector
					2 Falling Slew Rate Detector
					3 VIH/VIL Level Detector
[3:2]	LVL_SEL_SEC[1:0]	RW	0x1	Y	Secondary Input Comparator Level Selection. The LVL_SEL_SEC fields determines the levels on a differential signal for the Secondary Input Energy Detection block as follows.
					LVL_SEL_SEC Comparator Levels
					0 100-mv Differential
					1 150-mv Differential
					2 200-mv Differential
					3 RESERVED
[1:0]	LVL_SEL_PRI[1:0]	RW	0x1	Y	Primary Input Comparator Level Selection. The LVL_SEL_PRI field determines the levels on a differential signal for the Primary Input Energy Detection block as follows.
					LVL_SEL_PRI Comparator Levels
					0 100-mv Differential
					1 150-mv Differential
					2 200-mv Differential
					3 RESERVED

9.6.27 STAT0_INT Register; R27

The STAT0_INT register provides control of the STATUS0 output and Interrupt configuration. The STATUS0 pin is also used for test and diagnostic functions. The test configuration registers override the STAT0_INT register.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	STAT0_SEL[3:0]	RW	0x5	Y	STATUS0 Indicator Signal Select.
					STAT0CFG
					STATUS0 Information
					0 PRIREF Loss of Signal (LOS)
					1 SECREF Loss of Signal (LOS)
					2 PLL1 Loss of Lock (LOL)
					3 PLL1 R Divider, divided by 2 (when R Divider is not bypassed)
					4 PLL1 N Divider, divided by 2
					5 PLL2 Loss of Lock (LOL)
					6 PLL2 R Divider, divided by 2 (when R Divider is not bypassed)
					7 PLL2 N Divider, divided by 2
					8 PLL1 VCO Calibration Active (CAL)
					9 PLL2 VCO Calibration Active (CAL)
					10 Interrupt (INTR). Derived from INT_FLAG register bits.
					11 PLL1 M Divider, divided by 2 (when M Divider is not bypassed)
					12 PLL2 M Divider, divided by 2 (when M Divider is not bypassed)
					13 EEPROM Active
					14 PLL1 Secondary to Primary Switch in Automatic Mode
					15 PLL2 Secondary to Primary Switch in Automatic Mode
					The polarity of STATUS0 is set by the STAT0POL bit.
[3]	STAT0_POL	RW	1	Y	STATUS0 Output Polarity. The STAT0_POL bit defines the polarity of information presented on the STATUS0 output. If STAT0_POL is set to 1 then STATUS0 is active high, if STAT0_POL is 0 then STATUS0 is active low.
[2:0]	RSRVD	-	-	N	Reserved.

9.6.28 STAT1 Register; R28

The STAT1_INT register provides control of the STATUS1 output. The STATUS1 pin is also used for test and diagnostic functions. The test configuration registers override the STAT0 register.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	STAT1_SEL[3:0]	RW	0x2	Y	STATUS1 Indicator Signal Select. The STAT1_SEL field determines what information is presented on the STATUS1 output as follows.
					STAT1CFG
					STATUS1 Information
					0
					PRIREF Loss of Signal (LOS)
					1
					SECREF Loss of Signal (LOS)
					2
					PLL1 Loss of Lock (LOL)
					3
					PLL1 R Divider, divided by 2 (when R Divider is not bypassed)
					4
					PLL1 N Divider, divided by 2
					5
					PLL2 Loss of Lock (LOL)
					6
					PLL2 R Divider, divided by 2 (when R Divider is not bypassed)
					7
					PLL2 N Divider, divided by 2
					8
					PLL1 VCO Calibration Active (CAL)
					9
					PLL2 VCO Calibration Active (CAL)
					10
					Interrupt (INTR)
					11
					PLL1 M Divider, divided by 2 (when M Divider is not bypassed)
					12
					PLL2 M Divider, divided by 2 (when M Divider is not bypassed)
					13
					EEPROM Active
					14
					PLL1 Secondary to Primary Switch in Automatic Mode
					15
					PLL2 Secondary to Primary Switch in Automatic Mode
					The polarity of STATUS1 is set by the STAT1POL bit.
[3]	STAT1_POL	RW	1	Y	STATUS1 Output Polarity. The STAT1_POL bit defines the polarity of information presented on the STATUS1 output. If STAT1_POL is set to 1 then STATUS1 is active high, if STAT1_POL is 0 then STATUS1 is active low.
[2:0]	RSRVD	-	-	N	Reserved.

9.6.29 OSCCTL1 Register; R29

The OSCCTL1 register provides control over input reference clock features.

Bit #	Field	Type	Reset	NVM	Description
[7]	DETECT_BYP	RW	0	Y	Signal Detector Bypass. When DETECT_BYP is 1 the output of the Signal Detector's, both Primary and Secondary are ignored and the inputs are always considered to be valid by the PLL control state machines. The DETECT_BYP bit has no effect on the Interrupt register or STATUS output's.
[6]	RSRVD	-	-	N	Reserved.
[5]	TERM2GND_SEC	RW	0	Y	Differential Termination to GND Control for Secondary Input. When TERM2GND_SEC is 1 an internal 50ohm termination to GND is selected on the Secondary input in differential mode.
[4]	TERM2GND_PRI	RW	0	Y	Differential Termination to GND Control for Primary Input. When TERM2GND_PRI is 1 an internal 50ohm termination to GND is selected on the Primary input in differential mode.
[3]	DIFFTERM_SEC	RW	0	Y	Differential Termination Control for Secondary Input. When DIFFTERM_SEC is 1 an internal 100ohm termination is selected on the Secondary input in differential mode.
[2]	DIFFTERM_PRI	RW	1	Y	Differential Termination Control for Primary Input. When DIFFTERM_PRI is 1 an internal 100ohm termination is selected on the Primary input in differential mode.
[1]	AC_MODE_SEC	RW	1	Y	AC Coupling Mode for Secondary Input. When AC_MODE_SEC is 1, this enables the internal input biasing to support an externally AC coupled input signal on the SECREF inputs. When AC_MODE_SEC is 0, the internal input bias is not used.
[0]	AC_MODE_PRI	RW	0	Y	AC Coupling Mode for Primary Input. When AC_MODE_PRI is 1, this enables the internal input biasing to support an externally AC coupled input signal on the PRIREF inputs. When AC_MODE_PRI is 0, the internal input bias is not used.

9.6.30 PWDN Register; R30

The PWDN register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6]	CMOSCHPWD N	RW	0	Y	CMOS Output Channel Powerdown.
[5]	CH7PWDN	RW	0	Y	Output Channel 7 Powerdown. The CH7PWDN field allows Output Channel 7 to be powered down. When CH7PWDN is 1 the regulator that supplies the divider and output driver for channel 7 will be disabled.
[4]	CH6PWDN	RW	0	Y	Output Channel 6 Powerdown. The CH6PWDN field allows Output Channel 6 to be powered down. When CH6PWDN is 1 the regulator that supplies the divider and output driver for channel 6 will be disabled.
[3]	CH5PWDN	RW	0	Y	Output Channel 5 Powerdown. The CH5PWDN field allows Output Channel 5 to be powered down. When CH5PWDN is 1 the regulator that supplies the divider and output driver for channel 5 will be disabled.
[2]	CH4PWDN	RW	0	Y	Output Channel 4 Powerdown. The CH4PWDN field allows Output Channel 4 to be powered down. When CH4PWDN is 1 the regulator that supplies the divider and output driver for channel 4 will be disabled.
[1]	CH23PWDN	RW	0	Y	Output Channel 23 Powerdown. The CH23PWDN field allows Output Channel 23 to be powered down. When CH23PWDN is 1 the regulator that supplies the divider and output drivers of channel 23 will be disabled.
[0]	CH01PWDN	RW	0	Y	Output Channel 01 Powerdown. The CH01PWDN field allows Output Channel 01 to be powered down. When CH01PWDN is 1 the regulator that supplies the divider and output drivers of channel 01 will be disabled.

9.6.31 OUTCTL_0 Register; R31

The OUTCTL_0 register provides control over Output 0.

Bit #	Field	Type	Reset	NVM	Description
[7]	CH_0_1_MUX	RW	1	Y	Channel's 0 and 1 Clock Source Mux Control.
					CH_0_1_MUX
					0
					1
[6:5]	OUT_0_SEL[1:0]	RW	0x1	Y	Channel 0 Output Driver Format Select. The OUT_0_SEL field controls the Channel 0 Output Driver as shown below.
					OUT_0_SEL
					0
					1
					2
[4:3]	OUT_0_MODE1[1:0]	RW	0x2	Y	Channel 0 Output Driver Mode1 Select.
					OUT_0_MODE1
					0
					1
					2
					3
[2:1]	OUT_0_MODE2[1:0]	RW	0x0	Y	Channel 0 Output Driver Mode2 Select.
					OUT_0_MODE2
					0
					1
					2
					3
[0]	RSRVD	-	-	N	Reserved.

9.6.32 OUTCTL_1 Register; R32

The OUTCTL_1 register provides control over Output 1.

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6:5]	OUT_1_SEL[1:0]	RW	0x1	Y	Channel 1 Output Driver Format Select. The OUT_1_SEL field controls the Channel 1 Output Driver as shown below.
					OUT_1_SEL OUTPUT OPERATION
					0 Disabled
					1 AC-LVDS/AC-CML/AC-LVPECL
					2 HCSL
[4:3]	OUT_1_MODE1[1:0]	RW	0x2	Y	Channel 1 Output Driver Mode1 Select.
					OUT_1_MODE1 Diff-Mode, Itail CMOS-Mode, Out_P
					0 4-mA (AC-LVDS) Powerdown, tristate
					1 6-mA (AC-CML) Powerdown, low
					2 8-mA (AC-LVPECL) Powerup, negative polarity
[2:1]	OUT_1_MODE2[1:0]	RW	0x0	Y	Channel 1 Output Driver Mode2 Select.
					OUT_1_MODE2 Diff-Mode, Rload in HCSL mode CMOS=Mode, Out_N
					0 Tristate Powerdown, tristate
					1 50-ohm Powerdown, low
					2 100-ohm Powerup, negative polarity
[0]	RSRVD	-	-	N	Reserved.

9.6.33 OUTDIV_0_1 Register; R33

Channel [1:0] Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_0_1_DIV[7:0]	RW	0x1	Y	Channel's 0 and 1 Output Divider. The Channel 0 and 1 Divider, OUT_0_1_DIV, is a 8-bit divider. The valid values for OUT_0_1_DIV range from 1 to 256 as shown below.
					OUT_0_1_DIV DIVIDE RATIO
					0 By-Passed
					1 2
					2 3
					...
					255 256

9.6.34 OUTCTL_2 Register; R34

The OUTCTL_2 register provides control over Output 2.

Bit #	Field	Type	Reset	NVM	Description
[7]	CH_2_3_MUX	RW	1	Y	Channel's 2 and 3 Clock Source Mux Control.
					CH_2_3_MUX
					0
					1
[6:5]	OUT_2_SEL[1:0]	RW	0x1	Y	Channel 2 Output Driver Format Select. The OUT_2_SEL field controls the Channel 2 Output Driver as shown below.
					OUT_2_SEL
					0
					1
					2
					3
[4:3]	OUT_2_MODE1[1:0]	RW	0x2	Y	Channel 2 Output Driver Mode1 Select.
					OUT_2_MODE1
					0
					1
					2
					3
[2:1]	OUT_2_MODE2[1:0]	RW	0x0	Y	Channel 2 Output Driver Mode2 Select.
					OUT_2_MODE2
					0

[0]	RSRVD	-	-	N	Reserved.

9.6.35 OUTCTL_3 Register; R35

The OUTCTL_3 register provides control over Output 3.

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6:5]	OUT_3_SEL[1:0]	RW	0x1	Y	Channel 3 Output Driver Format Select. The OUT_3_SEL field controls the Channel 3 Output Driver as shown below.
					OUT_3_SEL OUTPUT OPERATION
					0 Disabled
					1 AC-LVDS/AC-CML/AC-LVPECL
					2 HCSL
[4:3]	OUT_3_MODE1[1:0]	RW	0x2	Y	Channel 3 Output Driver Mode1 Select.
					OUT_3_MODE1 Diff-Mode, Itail CMOS-Mode, Out_P
					0 4-mA (AC-LVDS) Powerdown, tristate
					1 6-mA (AC-CML) Powerdown, low
					2 8-mA (AC-LVPECL) Powerup, negative polarity
[2:1]	OUT_3_MODE2[1:0]	RW	0x0	Y	Channel 3 Output Driver Mode2 Select.
					OUT_3_MODE2 Diff-Mode, Rload in HCSL mode CMOS=Mode, Out_N
					0 Tristate Powerdown, tristate
					1 50-ohm Powerdown, low
					2 100-ohm Powerup, negative polarity
[0]	RSRVD	-	-	N	Reserved.

9.6.36 OUTDIV_2_3 Register; R36

Channel [3:2] Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_2_3_DIV[7:0]	RW	0x3	Y	Channel's 2 and 3 Output Divider. The Channel 2 and 3 Divider, OUT_2_3_DIV, is a 8-bit divider. The valid values for OUT_2_3_DIV range from 1 to 256 as shown below.
					OUT_2_3_DIV DIVIDE RATIO
					0 By-Passed
					1 2
					2 3
					...
					255 256

9.6.37 OUTCTL_4 Register; R37

The OUTCTL_4 register provides control over Output 4

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH_4_MUX[1:0]	RW	0x0	Y	Channel 4 Clock Source Mux Control.
					CH_4_MUX
					0
					1
					2
					3
					When the doubler is enabled the Primary and Secondary Reference options will reflect the frequency doubled reference. If the Primary or Secondary Reference options are selected the output divider is by-passed.
[5:4]	OUT_4_SEL[1:0]	RW	0x1	Y	Channel 4 Output Driver Format Select. The OUT_4_SEL field controls the Channel 4 Output Driver as shown below.
					OUT_1_SEL
					0
					1
					2
[3:2]	OUT_4_MODE1[1:0]	RW	0x2	Y	Channel 4 Output Driver Mode1 Select.
					OUT_4_MODE1
					0
					1
					2
					3
[1:0]	OUT_4_MODE2[1:0]	RW	0x0	Y	Channel 4 Output Driver Mode2 Select.
					OUT_4_MODE2
					0
					1
					2

9.6.38 OUTDIV_4 Register; R38

Channel 4 Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_4_DIV[7:0]	RW	0x2	Y	Channel 4 Output Divider. The Channel 4 Divider, OUT_4_DIV, is a 8-bit divider. The valid values for OUT_4_DIV range from 1 to 256 as shown below. The divider only operates on Channel 4 when the clock source is PLL1 or PLL2.
					OUT_4_DIV
					0
					1
					2
					...
					255

9.6.39 OUTCTL_5 Register; R39

The OUTCTL_5 register provides control over Output 5.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH_5_MUX[1:0]	RW	0x0	Y	Channel 5 Clock Source Mux Control.
					CH_5_MUX
					0
					1
					2
					3
					When the doubler is enabled the Primary and Secondary Reference options will reflect the frequency doubled reference. If the Primary or Secondary Reference options are selected the output divider is by-passed.
[5:4]	OUT_5_SEL[1:0]	RW	0x1	Y	Channel 5 Output Driver Format Select. The OUT_5_SEL field controls the Channel 5 Output Driver as shown below.
					OUT_1_SEL
					0
					1
					2
[3:2]	OUT_5_MODE1[1:0]	RW	0x2	Y	Channel 5 Output Driver Mode1 Select.
					OUT_5_MODE1
					0
					1
					2
					3
[1:0]	OUT_5_MODE2[1:0]	RW	0x0	Y	Channel 5 Output Driver Mode2 Select.
					OUT_5_MODE2
					0
					1
					2

9.6.40 OUTDIV_5 Register; R40

Channel 5 Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_5_DIV[7:0]	RW	0x2	Y	Channel 5 Output Divider. The Channel 5 Divider, OUT_5_DIV, is a 8-bit divider. The valid values for OUT_5_DIV range from 1 to 256 as shown below. The divider only operates on Channel 5 when the clock source is PLL1 or PLL2.
					OUT_5_DIV
					0
					1
					2
					...
					255

9.6.41 OUTCTL_6 Register; R41

The OUTCTL_6 register provides control over Output 6.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH_6_MUX[1:0]	RW	0x0	Y	Channel 6 Clock Source Mux Control.
					CH_6_MUX
					0
					1
					2
					3
					When the doubler is enabled the Primary and Secondary Reference options will reflect the frequency doubled reference. If the Primary or Secondary Reference options are selected the output divider is by-passed.
[5:4]	OUT_6_SEL[1:0]	RW	0x1	Y	Channel 6 Output Driver Format Select. The OUT_6_SEL field controls the Channel 6 Output Driver as shown below.
					OUT_1_SEL
					0
					1
					2
[3:2]	OUT_6_MODE1[1:0]	RW	0x2	Y	Channel 6 Output Driver Mode1 Select.
					OUT_6_MODE1
					0
					1
					2
					3
[1:0]	OUT_6_MODE2[1:0]	RW	0x0	Y	Channel 6 Output Driver Mode2 Select.
					OUT_6_MODE2
					0
					1
					2

9.6.42 OUTDIV_6 Register; R42

Channel 6 Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_6_DIV[7:0]	RW	0x5	Y	Channel 6 Output Divider. The Channel 6 Divider, OUT_6_DIV, is a 8-bit divider. The valid values for OUT_6_DIV range from 1 to 256 as shown below. The divider only operates on Channel 6 when the clock source is PLL1 or PLL2.
					OUT_6_DIV
					0
					1
					2
					...
					255

9.6.43 OUTCTL_7 Register; R43

The OUTCTL_7 register provides control over Output 7.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	CH_7_MUX[1:0]	RW	0x0	Y	Channel 7 Clock Source Mux Control.
					CH_7_MUX
					0
					1
					2
					3
					When the doubler is enabled the Primary and Secondary Reference options will reflect the frequency doubled reference. If the Primary or Secondary Reference options are selected the output divider is by-passed.
[5:4]	OUT_7_SEL[1:0]	RW	0x1	Y	Channel 7 Output Driver Format Select. The OUT_7_SEL field controls the Channel 7 Output Driver as shown below.
					OUT_1_SEL
					0
					1
					2
					3
[3:2]	OUT_7_MODE1[1:0]	RW	0x2	Y	Channel 7 Output Driver Mode1 Select.
					OUT_7_MODE1
					0
					1
					2
					3
[1:0]	OUT_7_MODE2[1:0]	RW	0x0	Y	Channel 7 Output Driver Mode2 Select.
					OUT_7_MODE2
					0
					1
					2
					3

9.6.44 OUTDIV_7 Register; R44

Channel 7 Output Divider

Bit #	Field	Type	Reset	NVM	Description
[7:0]	OUT_7_DIV[7:0]	RW	0x5	Y	Channel 7 Output Divider. The Channel 7 Divider, OUT_7_DIV, is a 8-bit divider. The valid values for OUT_7_DIV range from 1 to 256 as shown below. The divider only operates on Channel 7 when the clock source is PLL1 or PLL2.
					OUT_7_DIV
					0
					1
					2
					...
					255

9.6.45 CMOSDIVCTRL Register; R45

CMOS Output Divider Control. The CMOS Clock Outputs provided on STATUS0 and STATUS1 can come from either CMOS Divider0 or CMOS Divider1. Additionally the clock source routed to the CMOS Dividers can come from either the PLL1 LVCMOS Pre-Divider or the PLL2 LVCMOS Pre-Divider.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	PLL2CMOSPREDIV[1:0]	RW	0x0	Y	PLL2 LVCMOS Pre-Divider Selection. The PLL2CMOSPREDIV field selects the divider value for the PLL2 pre-divider that drives the CMOS Dividers.
					PLL2CMOSPREDIV Divider Value
					0 Disabled
					1 4
					2 5
					3 Reserved
[5:4]	PLL1CMOSPREDIV[1:0]	RW	0x0	Y	PLL1 LVCMOS Pre-Divider Selection. The PLL1CMOSPREDIV field selects the divider value for the PLL1 pre-divider that drives the CMOS Dividers.
					PLL1CMOSPREDIV Divider Value
					0 Disabled
					1 4
					2 5
					3 Reserved
[3:2]	STATUS1MUX[1:0]	RW	0x2	Y	STATUS1 Mux Selection. The STATUS1MUX field controls the signal source for the STATUS1 Pin as described below.
					STATUS1MUX STATUS1 OPERATION
					0 LVCMOS Clock, from STATUS0 Divider
					1 LVCMOS Clock, from STATUS1 Divider
					2 Normal Status Operation
					3 STATUS1 Disabled
[1:0]	STATUS0MUX[1:0]	RW	0x2	Y	STATUS0 Mux Selection. The STATUS0MUX field controls the signal source for the STATUS0 Pin as described below.
					STATUS0MUX STATUS0 OPERATION
					0 LVCMOS Clock, from STATUS0 Divider
					1 LVCMOS Clock, from STATUS1 Divider
					2 Normal Status Operation
					3 STATUS0 Disabled

9.6.46 CMOSDIV0 Register; R46

CMOS Output Divider 0

Bit #	Field	Type	Reset	NVM	Description														
[7:0]	CMOSDIV0[7:0]	RW	0x0	Y	CMOS Output Divider 0. The CMOS Divider0, CMOSDIV0, is a 8-bit divider that divides the clock source from the PLL1 LVCMOS Pre-Divider output. The valid values for CMOSDIV0 range from 1 to 256 as shown below. <table><tr><th>CMOSDIV0</th><th>DIVIDE RATIO</th></tr><tr><td>0</td><td>Disabled</td></tr><tr><td>1..5</td><td>6</td></tr><tr><td>6</td><td>7</td></tr><tr><td>7</td><td>8</td></tr><tr><td>...</td><td></td></tr><tr><td>255</td><td>256</td></tr></table> Whenever CMOS Divider0 is disabled, by setting CMOSDIV0 to 0, a Software reset should be issued, by setting SWRCMOSCH to 1, after the divider is programmed to a nonzero value.	CMOSDIV0	DIVIDE RATIO	0	Disabled	1..5	6	6	7	7	8	...		255	256
CMOSDIV0	DIVIDE RATIO																		
0	Disabled																		
1..5	6																		
6	7																		
7	8																		
...																			
255	256																		

9.6.47 CMOSDIV1 Register; R47

CMOS Output Divider 1

Bit #	Field	Type	Reset	NVM	Description	
[7:0]	CMOSDIV1[7:0]	RW	0x0	Y	CMOS Output Divider 1. The CMOS Divider1, CMOSDIV1, is a 8-bit divider that divides the clock source from the PLL2 LVCMOS Pre-Divider output. The valid values for CMOSDIV1 range from 1 to 256 as shown below.	
					CMOSDIV1	DIVIDE RATIO
					0	Disabled
					1..5	6
					6	7
					7	8
					...	
					255	256
					Whenever CMOS Divider1 is disabled, by setting CMOSDIV1 to 0, a Software reset should be issued, by setting SWRCMOSCH to 1, after the divider is programmed to a nonzero value.	

LMK03328

SNAS668 –AUGUST 2015

www.ti.com
9.6.48 STATUS_SLEW Register; R49

Status CMOS Output Slew Control

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:2]	STATUS1SLEW[1:0]	RW	0x0	Y	STATUS1 Slew Control. The STATUS1SLEW field controls the slew rate of the STATUS1 output as shown below.
					STATUS1SLEW STATUS1 Rise/Fall Time
					0 Fast (0.35-ns)
					1 RESERVED
					2 Slow (2.1-ns)
[1:0]	STATUS0SLEW[1:0]	RW	0x0	Y	STATUS0 Slew Control. The STATUS0SLEW field controls the slew rate of the STATUS0 output as shown below.
					STATUS0SLEW STATUS0 Rise/Fall Time
					0 Fast (0.35-ns)
					1 RESERVED
					2 Slow (2.1-ns)
					3 RESERVED

9.6.49 IPCLKSEL Register; R50

Input Clock Select

Bit #	Field	Type	Reset	NVM	Description
[7:6]	SECBUFSEL[1:0]	RW	0x2	Y	Secondary Input Buffer Selection. SECBUFSEL configures the Secondary Input Buffer as follows.
					SECBUFSEL Mode
					b00 Single-ended Input
					b01 Differential Input
					b10 Crystal Input
					b11 Disabled
[5:4]	PRIBUFSEL[1:0]	RW	0x1	Y	Primary Input Buffer Selection. PRIBUFSEL configures the Primary Input Buffer as follows.
					PRIBUFSEL Mode
					b00 Single-ended Input
					b01 Differential Input
					b10 Disabled
					b11 Disabled
[3:2]	INSEL_PLL2[1:0]	RW	0x1	Y	Reference Input Selection for PLL2. INSEL_PLL2 Determines the input select for PLL2 as follows.
					INSEL_PLL2 Input Mode
					b00 Automatic, Primary is preferred.
					b01 Determined by external pin, REFSEL.
					b10 Primary Input Selected.
					b11 Secondary Input Selected.
					When INSEL_PLL2 is equal to b01 the REFSEL pin determines the reference clock source for PLL2 as follows.
					REFSEL PLL2 Reference Clock
					0 PLL2 Reference is Secondary Input
					V _{IM} PLL2 Reference is Secondary Input
					1 PLL2 Input MUX is set to Automatic Mode
[1:0]	INSEL_PLL1[1:0]	RW	0x1	Y	Reference Input Selection for PLL1. INSEL_PLL1 Determines the input select for PLL1 as follows.
					INSEL_PLL1 Input Mode
					b00 Automatic, Primary is preferred.
					b01 Determined by external pin, REFSEL.
					b10 Primary Input Selected.
					b11 Secondary Input Selected.
					When INSEL_PLL1 is equal to b01 the REFSEL pin determines the reference clock source for PLL1 as follows.
					REFSEL PLL1 Reference Clock
					0 PLL1 Reference is Primary input
					V _{IM} PLL1 Input MUX is set to Automatic Mode
					1 PLL1 Input MUX is set to Automatic Mode

9.6.50 IPCLKCTL Register; R51

Input Clock Control

Bit #	Field	Type	Reset	NVM	Description
[7]	CLKMUX_BY PASS	RW	0	Y	Clock Mux Bypass. Controls whether the glitch-less clock mux on the the Primary and Secondary Reference paths is enabled. When CLKMUX_BYPASS is 1 then the clock mux is by-passed.
[6:3]	RSRVD	RW	0x0	Y	Reserved.
[2]	SECONSWIT CH	RW	0	Y	Secondary Crystal Input Buffer On after Switch. Determines whether the Secondary Crystal Input Buffer remains on after a switch back to the Primary Input. If SECONSWITCH is 0 then the Secondary Crystal Input Buffer is disabled after a switch back to the Primary input. If SECONSWITCH is 1 then the Secondary Crystal Input Buffer remains active after a switch back to the Primary input.
[1]	SECBUF GAIN	RW	1	Y	Secondary Input Buffer Gain.
					SECBUF GAIN
					0
					1
[0]	PRIBUF GAIN	RW	1	Y	Primary Input Buffer Gain.
					PRIBUF GAIN
					0
					1

9.6.51 PLL1_RDIV Register; R52

R Divider for PLL1

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL1RDIV[2: 0]	RW	0x0	Y	PLL1 R Divider. PLL1 R Divider ratio is set by PLL1RDIV.
					PLL1RDIV
					0
					1
					...
					7
					8

9.6.52 PLL1_MDIV Register; R53

M Divider for PLL1

Bit #	Field	Type	Reset	NVM	Description
[7:5]	RSRVD	-	-	N	Reserved.
[4:0]	PLL1MDIV[4: 0]	RW	0x0	Y	PLL1 M Divider. PLL1 M Divider ratio is set by PLL1MDIV.
					PLL1MDIV
					0
					1
					...
					31
					32

9.6.53 PLL2_RDIV Register; R54

R Divider for PLL2

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL2RDIV[2:0]	RW	0x0	Y	PLL2 R Divider. PLL2 R Divider ratio is set by PLL2RDIV.
	PLL2RDIV				PLL2 R-Divider Value
	0				Bypass
	1				2
	...				...
	7				8

9.6.54 PLL2_MDIV Register; R55

M Divider for PLL2

Bit #	Field	Type	Reset	NVM	Description
[7:5]	RSRVD	-	-	N	Reserved.
[4:0]	PLL2MDIV[4:0]	RW	0x0	Y	PLL2 M Divider. PLL2 M Divider ratio is set by PLL2MDIV.
	PLL2MDIV				PLL2 M-Divider Value
	0				Bypass
	1				2
	...				...
	31				32

9.6.55 PLL1_CTRL0 Register; R56

The PLL1_CTRL0 register provides control of PLL1. The PLL1_CTRL0 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:5]	RSRVD	-	-	N	Reserved.
[4:2]	PLL1_P[2:0]	RW	0x7	Y	PLL1 Post-Divider. The PLL1_P field selects the PLL1 post-divider value as follows.
	PLL1_P				Post Divider Value
	0				2
	1				2
	2				3
	3				4
	4				5
	5				6
	6				7
	7				8
[1]	PLL1_SYNC_EN	RW	1	Y	PLL1 SYNC Enable. If PLL1_SYNC_EN is 1 then a SYNC event will cause all channels which use PLL1 as a clock source to be re-synchronized.
[0]	PLL1_PDN	RW	0	Y	PLL1 Powerdown. The PLL1_PDN bit determines whether PLL1 is automatically enabled and calibrated after a hardware reset. If the PLL1_PDN bit is set to 1 during normal operation then PLL1 is disabled and the calibration circuit is reset. When PLL1_PDN is then cleared to 0 PLL1 is re-enabled and the calibration sequence is automatically restarted.
	PLL1_PDN				PLL1 STATE
	0				PLL1 Enabled
	1				PLL1 Disabled

9.6.56 PLL1_CTRL1 Register; R57

The PLL1_CTRL1 register provides control of PLL1. The PLL1_CTRL1 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5]	RSRVD	RW	0	Y	Reserved.
[4]	PRI_D	RW	1	Y	Primary Reference Doubler Enable. If PRI_D is 1 the Primary Input Frequency Doubler is enabled.
[3:0]	PLL1_CP[3:0]	RW	0x8	Y	PLL1 Charge Pump Gain. The PLL1_CP sets the chargepump current as follows.
					PLL1_CP Icp (mA)
					b0001 0.4
					b0010 0.8
					b0100 1.6
					b1000 6.4
					b0011 1.2
					b0101 2.0
					b0110 2.4
					b0111 2.8

9.6.57 PLL1_NDIV_BY1 Register; R58

The 12-bit N integer divider value for PLL1 is set by the PLL1_NDIV_BY1 and PLL1_NDIV_BY0 registers.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:0]	PLL1_NDIV[11:8]	RW	0x0	Y	PLL1 N Divider Byte 1. PLL1 Integer N Divider bits 11 to 8.
					PLL1_NDIV DIVIDER RATIO
					0 1
					1 1
					
					4095 4095

9.6.58 PLL1_NDIV_BY0 Register; R59

The PLL1_NDIV_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL1_NDIV[7:0]	RW	0x66	Y	PLL1 N Divider Byte 0. PLL1 Integer N Divider bits 7 to 0.

9.6.59 PLL1_FRACNUM_BY2 Register; R60

The Fractional Divider Numerator value for PLL1 is set by registers PLL1_FRACNUM_BY2, PLL1_FRACNUM_BY1 and PLL1_FRACNUM_BY0.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5:0]	PLL1_NUM[21:16]	RW	0x0	Y	PLL1 Fractional Divider Numerator Byte 2. Bits 21 to 16.

9.6.60 PLL1_FRACNUM_BY1 Register; R61

The PLL1_FRACNUM_BY1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL1_NUM[15:8]	RW	0x0	Y	PLL1 Fractional Divider Numerator Byte 1. Bits 15 to 8.

9.6.61 PLL1_FRACNUM_BY0 Register; R62

The PLL1_FRACNUM_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL1_NUM[7:0]	RW	0x0	Y	PLL1 Fractional Divider Numerator Byte 0. Bits 7 to 0.

9.6.62 PLL1_FRACDEN_BY2 Register; R63

The Fractional Divider Denominator value for PLL1 is set by registers PLL1_FRACDEN_BY2, PLL1_FRACDEN_BY1 and PLL1_FRACDEN_BY0.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5:0]	PLL1_DEN[21:16]	RW	0x0	Y	PLL1 Fractional Divider Denominator Byte 2. Bits 21 to 16.

9.6.63 PLL1_FRACDEN_BY1 Register; R64

The PLL1_FRACDEN_BY1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL1_DEN[15:8]	RW	0x0	Y	PLL1 Fractional Divider Denominator Byte 1. Bits 15 to 8.

9.6.64 PLL1_FRACDEN_BY0 Register; R65

The PLL1_FRACDEN_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL1_DEN[7:0]	RW	0x0	Y	PLL1 Fractional Divider Denominator Byte 0. Bits 7 to 0.

9.6.65 PLL1_MASHCTRL Register; R66

The PLL1_MASHCTRL register provides control of the fractional divider for PLL1.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:2]	PLL1_DTHR MODE[1:0]	RW	0x3	Y	Mash Engine dither mode control.
					DITHERMODE
					00
					01
					10
					11
[1:0]	PLL1_ORDE R[1:0]	RW	0x0	Y	Mash Engine Order.
					ORDER
					00
					01
					10
					11

9.6.66 PLL1_LF_R2 Register; R67

The PLL1_LF_R2 register controls the value of the PLL1 Loop Filter R2.

Bit #	Field	Type	Reset	NVM	Description	
[7:6]	RSRVD	-	-	N	Reserved.	
[5:0]	PLL1_LF_R2[5:0]	RW	0x24	Y	PLL1 Loop Filter R2. NOTE: Table below lists commonly used R2 values but more selections are available.	
					PLL1_LF_R2[5:0]	R2 (ohm)
					b000001	236
					b000010	336
					b000100	536
					b001000	735
					b100000	1636
					B110000	2418

9.6.67 PLL1_LF_C1 Register; R68

The PLL1_LF_C1 register controls the value of the PLL1 Loop Filter C1.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL1_LF_C1[2:0]	RW	0x0	Y	PLL1 Loop Filter C1. The value in pF is given by $5 + 50 * \text{PLL1_LF_C1}$ (in binary).

9.6.68 PLL1_LF_R3 Register; R69

The PLL1_LF_R3 register controls the value of the PLL1 Loop Filter R3.

Bit #	Field	Type	Reset	NVM	Description																
[7]	RSRVD	-	-	N	Reserved.																
[6:0]	PLL1_LF_R3[6:0]	RW	0x0	Y	PLL1 Loop Filter R3. 9.6.69 PLL1_LF_C3 Register; R70

The PLL1_LF_C3 register controls the value of the PLL1 Loop Filter C3.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL1_LF_C3[2:0]	RW	0x0	Y	PLL1 Loop Filter C3. The value in pF is given by $5 * \text{PLL1_LF_C3}$ (in binary).

9.6.70 PLL2_CTRL0 Register; R71

The PLL2_CTRL0 register provides control of PLL2. The PLL2_CTRL0 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:5]	RSRVD	-	-	N	Reserved.
[4:2]	PLL2_P[2:0]	RW	0x7	Y	PLL2 Post-Divider. The PLL2_P field selects the PLL2 post-divider value as follows.
					PLL2_P
					Post Divider Value
					0
					2
					1
					2
					2
					3
					4
[1]	PLL2_SYNC_EN	RW	1	Y	PLL2 SYNC Enable. If PLL2_SYNC_EN is 1 then a SYNC event will cause all channels which use PLL2 has a clock source to be re-synchronized.
[0]	PLL2_PDN	RW	0	Y	PLL2 Powerdown. The PLL2_PDN bit determines whether PLL2 is automatically enabled and calibrated after a hardware reset. If the PLL2_PDN bit is set to 1 during normal operation then PLL2 is disabled and the calibration circuit is reset. When PLL2_PDN is then cleared to 0 PLL2 is re-enabled and the calibration sequence is automatically restarted.
					PLL2_PDN
					PLL2 STATE
					0
					PLL2 Enabled
					1
					PLL2 Disabled

9.6.71 PLL2_CTRL1 Register; R72

The PLL2_CTRL1 register provides control of PLL2. The PLL2_CTRL1 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5]	RSRVD	RW	0	Y	Reserved.
[4]	SEC_D	RW	1	Y	Secondary Reference Doubler Enable. If SEC_D is 1 the Secondary Input Frequency Doubler is enabled.
[3:0]	PLL2_CP[3:0]	RW	0x8	Y	PLL2 Charge Pump Gain. The PLL2_CP sets the charge pump current as follows.
					PLL2_CP
					Icp (mA)
					b0001
					0.4
					b0010
					0.8
					b0100
					1.6
					b1000
					6.4
					b0011
					1.2
					b0101
					2.0
					b0110
					2.4
					b0111
					2.8

9.6.72 PLL2_NDIV_BY1 Register; R73

The 12-bit N integer divider value for PLL2 is set by the PLL2_NDIV_BY1 and PLL2_NDIV_BY0 registers.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:0]	PLL2_NDIV[11:8]	RW	0x0	Y	PLL2 N Divider Byte 1. PLL2 Integer N Divider bits 11 to 8.
					PLL2_NDIV DIVIDER RATIO
					0 1
					1 1
					... 4095

9.6.73 PLL2_NDIV_BY0 Register; R74

The PLL2_NDIV_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL2_NDIV[7:0]	RW	0x64	Y	PLL2 N Divider Byte 0. PLL2 Integer N Divider bits 7 to 0.

9.6.74 PLL2_FRACNUM_BY2 Register; R75

The Fractional Divider Numerator value for PLL2 is set by registers PLL2_FRACNUM_BY2, PLL2_FRACNUM_BY1 and PLL2_FRACNUM_BY0.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5:0]	PLL2_NUM[21:16]	RW	0x0	Y	PLL2 Fractional Divider Numerator Byte 2. Bits 21 to 16.

9.6.75 PLL2_FRACNUM_BY1 Register; R76

The PLL2_FRACNUM_BY1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL2_NUM[15:8]	RW	0x0	Y	PLL2 Fractional Divider Numerator Byte 1. Bits 15 to 8.

9.6.76 PLL2_FRACNUM_BY0 Register; R77

The PLL2_FRACNUM_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL2_NUM[7:0]	RW	0x0	Y	PLL2 Fractional Divider Numerator Byte 0. Bits 7 to 0.

9.6.77 PLL2_FRACDEN_BY2 Register; R78

The Fractional Divider Denominator value for PLL2 is set by registers PLL2_FRACDEN_BY2, PLL2_FRACDEN_BY1 and PLL2_FRACDEN_BY0.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5:0]	PLL2_DEN[21:16]	RW	0x0	Y	PLL2 Fractional Divider Denominator Byte 2. Bits 21 to 16.

9.6.78 PLL2_FRACDEN_BY1 Register; R79

The PLL2_FRACDEN_BY1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL2_DEN[15:8]	RW	0x0	Y	PLL2 Fractional Divider Denominator Byte 1. Bits 15 to 8.

9.6.79 PLL2_FRACDEN_BY0 Register; R80

The PLL2_FRACDEN_BY0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	PLL2_DEN[7:0]	RW	0x0	Y	PLL2 Fractional Divider Denominator Byte 0. Bits 7 to 0.

9.6.80 PLL2_MASHCTRL Register; R81

The PLL2_MASHCTRL register provides control of the fractional divider for PLL2.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:2]	PLL2_DTHR MODE[1:0]	RW	0x3	Y	Mash Engine dither mode control.
					DITHERMODE
					00 Weak
					01 Medium
					10 Strong
[1:0]	PLL2_ORDE R[1:0]	RW	0x0	Y	11 Dither Disabled
					Mash Engine Order.
					ORDER
					00 Integer Mode Divider
					01 1st order
					10 2nd order
					11 3rd order

9.6.81 PLL2_LF_R2 Register; R82

The PLL2_LF_R2 register controls the value of the PLL2 Loop Filter R2.

Bit #	Field	Type	Reset	NVM	Description
[7:6]	RSRVD	-	-	N	Reserved.
[5:0]	PLL2_LF_R2[5:0]	RW	0x24	Y	PLL2 Loop Filter R2. NOTE: Table below lists commonly used R2 values but more selections are available.
					PLL2_LF_R2[5:0] R2 (ohm)
					b000001 236
					b000010 336
					b000100 536
					b001000 735
					b100000 1636
					B110000 2418

9.6.82 PLL2_LF_C1 Register; R83

The PLL2_LF_C1 register controls the value of the PLL2 Loop Filter C1.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL2_LF_C1[2:0]	RW	0x0	Y	PLL2 Loop Filter C1. The value in pF is given by $5 + 50 * \text{PLL2_LF_C1 (in binary)}$.

9.6.83 PLL2_LF_R3 Register; R84

The PLL2_LF_R3 register controls the value of the PLL2 Loop Filter R3.

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6:0]	PLL2_LF_R3[6:0]	RW	0x0	Y	PLL2 Loop Filter R3. NOTE: Table below lists commonly used R3 values but more selections are available.
	PLL2_LF_R3[6:0]				R3 (ohm)
	b0000000				18
	b0000010				318
	b0000100				518
	b0001000				717
	b0010000				854
	b0100000				1654
	b1000000				3254

9.6.84 PLL2_LF_C3 Register; R85

The PLL2_LF_C3 register controls the value of the PLL2 Loop Filter C3.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL2_LF_C3[2:0]	RW	0x0	Y	PLL2 Loop Filter C3. The value in pF is given by 5 * PLL2_LF_C3 (in binary).

9.6.85 XO_MARGINING Register; R86

Margin Control

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6:4]	MARGIN_DIG_STEP[2:0]	R	0x0	N	Margin Digital Step. MARGIN_DIG_STEP allows the current level of the margin selection pin (GPIO[5]) to be read.
					MARGIN_DIG_STEP
					Value
					0
					STEP1
					1
					STEP2
					2
					STEP3
[3:2]	MARGIN_OPTION[1:0]	RW	0x0	Y	Margin Option Select. The MARGIN_OPTION field defines the operation of the Frequency Margining as follows.
					MARGIN_OPTIONS
					MARGIN Mode
					0
					Margining Enabled when GPIO4 pin is low. GPIO5 pin selects the frequency offset setting (STEP1 to STEP8). When GPIO4 pin is high, STEP4 offset value is selected to use the nominal crystal loading.
					1
					Margining Enabled. GPIO5 pin selects the frequency offset setting (STEP1 to STEP8). GPIO4 pin state is ignored.
					2
					Margining Enabled. Frequency offset is controlled by XOOFFSET_SW register bits (R104 and R105).
[1:0]	RSRVD	-	-	N	Reserved.

9.6.86 XO_OFFSET_GPIO5_STEP_1_BY1 Register; R88

XO Margining Step 1 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_STEP1[9:8]	RW	0x0	Y	XO Margining Step 1 Offset Value.

9.6.87 XO_OFFSET_GPIO5_STEP_1_BY0 Register; R89

XO Margining Step 1 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_STEP1[7:0]	RW	0xDE	Y	XO Margining Step 1 Offset Value.

9.6.88 XO_OFFSET_GPIO5_STEP_2_BY1 Register; R90

XO Margining Step 1 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP2[9:8]	RW	0x1	Y	XO Margining Step 2 Offset Value.

9.6.89 XO_OFFSET_GPIO5_STEP_2_BY0 Register; R91

XO Margining Step 2 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP2[7:0]	RW	0x18	Y	XO Margining Step 2 Offset Value.

9.6.90 XO_OFFSET_GPIO5_STEP_3_BY1 Register; R92

XO Margining Step 3 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP3[9:8]	RW	0x1	Y	XO Margining Step 3 Offset Value.

9.6.91 XO_OFFSET_GPIO5_STEP_3_BY0 Register; R93

XO Margining Step 3 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP3[7:0]	RW	0x4B	Y	XO Margining Step 3 Offset Value.

9.6.92 XO_OFFSET_GPIO5_STEP_4_BY1 Register; R94

XO Margining Step 4 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP4[9:8]	RW	0x1	Y	XO Margining Step 4 Offset Value.

9.6.93 XO_OFFSET_GPIO5_STEP_4_BY0 Register; R95

XO Margining Step 4 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP4[7:0]	RW	0x86	Y	XO Margining Step 4 Offset Value.

9.6.94 XO_OFFSET_GPIO5_STEP_5_BY1 Register; R96

XO Margining Step 5 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP5[9:8]	RW	0x1	Y	XO Margining Step 5 Offset Value.

9.6.95 XO_OFFSET_GPIO5_STEP_5_BY0 Register; R97

XO Margining Step 5 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP5[7:0]	RW	0xBE	Y	XO Margining Step 5 Offset Value.

9.6.96 XO_OFFSET_GPIO5_STEP_6_BY1 Register; R98

XO Margining Step 6 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP6[9:8]	RW	0x1	Y	XO Margining Step 6 Offset Value.

9.6.97 XO_OFFSET_GPIO5_STEP_6_BY0 Register; R99

XO Margining Step 6 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP6[7:0]	RW	0xFE	Y	XO Margining Step 6 Offset Value.

9.6.98 XO_OFFSET_GPIO5_STEP_7_BY1 Register; R100

XO Margining Step 7 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP7[9:8]	RW	0x2	Y	XO Margining Step 7 Offset Value.

9.6.99 XO_OFFSET_GPIO5_STEP_7_BY0 Register; R101

XO Margining Step 7 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP7[7:0]	RW	0x47	Y	XO Margining Step 7 Offset Value.

9.6.100 XO_OFFSET_GPIO5_STEP_8_BY1 Register; R102

XO Margining Step 8 Offset Value (bits 9-8)

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_S TEP8[9:8]	RW	0x2	Y	XO Margining Step 8 Offset Value.

9.6.101 XO_OFFSET_GPIO5_STEP_8_BY0 Register; R103

XO Margining Step 8 Offset Value (bits 7-0)

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_S TEP8[7:0]	RW	0x9E	Y	XO Margining Step 8 Offset Value.

9.6.102 XO_OFFSET_SW_BY1 Register; R104

Software Controlled XO Margining Offset Value (bits 9-8).

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XOOFFSET_SW[9:8]	RW	0x0	Y	XO Margining Software Controlled Offset Value.

9.6.103 XO_OFFSET_SW_BY0 Register; R105

Software Controlled XO Margining Offset Value (bits 7-0).

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XOOFFSET_SW[7:0]	RW	0x0	Y	XO Margining Software Controlled Offset Value.

9.6.104 PLL1_CTRL2 Register; R117

The PLL1_CTRL2 register provides control of PLL1. The PLL1_CTRL2 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7]	PLL1_STRETCH	RW	0	Y	Stretch PFD minimum pump width in fractional mode. A value of 0 is recommended for Integer-N PLL and sets the phase detector pulse width to 200-ps. A value of 1 is recommended for Fractional-N PLL and stretches the pulse width to roughly 600-ps.
[6:0]	RSRVD	-	-	N	Reserved.

9.6.105 PLL1_CTRL3 Register; R118

The PLL1_CTRL3 register provides control of PLL1. The PLL1_CTRL3 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL1_DISABLE_4TH[2:0]	RW	0x3	Y	PLL1 Loop Filter Settings.
					PLL1_DISABLE_4TH[2:0] MODE
					0, 1, 2 RESERVED
					3 2nd Order Loop Filter Recommended Setting for Integer PLL Mode.
					4, 5, 6 RESERVED
					7 3rd Order Loop Filter Recommended Setting for Fractional PLL Mode.

9.6.106 PLL1_CALCTRL0 Register; R119

The PLL1_CALCTRL0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:2]	PLL1_CLSDWAIT[1:0]	RW	0x0	Y	Closed Loop Wait Period. The CLSDWAIT field sets the closed loop wait period, in periods of the always on clock as follows. Use 0x1 for clock generator mode (> 10-kHz loop bandwidth) and 0x3 for jitter cleaner mode (< 1-kHz loop bandwidth).
					CLSDWAIT
					Analog closed loop VCO stabilization time
					0
					30-us
[1:0]	PLL1_VCOWAIT[1:0]	RW	0x1	Y	VCO Wait Period. Use 0x1 for all modes.
					VCOWAIT
					VCO stabilization time
					0
					20-us
					1
					400-us
					2
					8000-us
					3
					200000-us

9.6.107 PLL1_CALCTRL1 Register; R120

The PLL1_CALCTRL1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:1]	RSRVD	-	-	N	Reserved.
[0]	PLL1_LOOPBW	RW	0	Y	PLL1 Loop bandwidth Control. When PLL1_LOOPBW is 1 the loop bandwidth of PLL1 is reduced to 200-Hz (jitter cleaner mode). When PLL1_LOOPBW is 0 the loop bandwidth of PLL1 is set to its normal range (clock generator mode). NOTE: Proper PLL settings need to be utilized (PFD, charge pump, loop filter) with setting the desired value for PLL1_LOOPBW.

9.6.108 PLL2_CTRL2 Register; R131

The PLL2_CTRL2 register provides control of PLL2. The PLL2_CTRL2 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7]	PLL2_STRETCH	RW	0	Y	Stretch PFD minimum pump width in fractional mode. A value of 0 is recommended for Integer-N PLL and sets the phase detector pulse width to 200-ps. A value of 1 is recommended for Fractional-N PLL and stretches the pulse width to roughly 600-ps.
[6:0]	RSRVD	-	-	N	Reserved.

9.6.109 PLL2_CTRL3 Register; R132

The PLL2_CTRL3 register provides control of PLL2. The PLL2_CTRL3 register fields are described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:3]	RSRVD	-	-	N	Reserved.
[2:0]	PLL2_DISAB LE_4TH[2:0]	RW	0x3	Y	PLL2 Loop Filter Settings.
					PLL2_DISABLE_4TH[2:0] MODE
					0, 1, 2 RESERVED
					3 2nd Order Loop Filter Recommended Setting for Integer PLL Mode.
					4, 5, 6 RESERVED
					7 3rd Order Loop Filter Recommended Setting for Fractional PLL Mode.

9.6.110 PLL2_CALCTRL0 Register; R133

The PLL2_CALCTRL0 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:2]	PLL2_CLSD WAIT[1:0]	RW	0x0	Y	Closed Loop Wait Period. The CLSDWAIT field sets the closed loop wait period, in periods of the always on clock as follows. Use 0x1 for clock generator mode (> 10-kHz loop bandwidth) and 0x3 for jitter cleaner mode (< 1-kHz loop bandwidth).
					CLSDWAIT Anlog closed loop VCO stabilization time
					0 30-us
					1 300-us
					2 30-ms
[1:0]	PLL2_VCOW AIT[1:0]	RW	0x1	Y	VCO Wait Period. Use 0x1 for all modes.
					VCOWAIT VCO stabilization time
					0 20-us
					1 400-us
					2 8000-us
					3 200000-us

9.6.111 PLL2_CALCTRL1 Register; R134

The PLL2_CALCTRL1 register is described in the following table.

Bit #	Field	Type	Reset	NVM	Description
[7:1]	RSRVD	-	-	N	Reserved.
[0]	PLL2_LOOPB W	RW	0	Y	PLL2 Loop bandwidth Control. When PLL2_LOOPBW is 1 the loop bandwidth of PLL2 is reduced to 200-Hz (jitter cleaner mode). When PLL2_LOOPBW is 0 the loop bandwidth of PLL2 is set to its normal range (clock generator mode). NOTE: Proper PLL settings need to be utilized (PFD, charge pump, loop filter) with setting the desired value for PLL2_LOOPBW.

9.6.112 NVMCNT Register; R136

The NVMCNT register is intended to reflect the number of on-chip EEPROM Erase/Program cycles that have taken place in EEPROM. The count is automatically incremented by hardware and stored in EEPROM.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	NVMCNT[7:0]	R	0x0	Y	NVM Program Count. The NVMCNT increments automatically after every EEPROM Erase/Program Cycle. The NVMCNT value is retrieved automatically after reset, after a NVM Commit operation or after a Erase/Program cycle. The NVMCNT register will increment until it reaches its maximum value of 255 after which no further increments will take place.

9.6.113 NVMCTL Register; R137

The NVMCTL register allows control of the on-chip EEPROM Memories.

Bit #	Field	Type	Reset	NVM	Description
[7]	RSRVD	-	-	N	Reserved.
[6]	REGCOMMIT	RWSC	0	N	REG Commit to NVM SRAM Array. The REGCOMMIT bit is used to initiate a transfer from the on-chip registers back to the corresponding location in the NVM SRAM Array. The REGCOMMIT bit is automatically cleared to 0 when the transfer is complete. The particular page of SRAM used as the destination for the transfer is selected by the REGCOMMIT_PAGE register.
[5]	NVMCRCERR	R	0	N	NVM CRC Error Indication. The NVMCRCERR bit is set to 1 if a CRC Error has been detected when reading back from on-chip EEPROM during device configuration.
[4]	NVMAUTOCRC	RW	1	N	NVM Automatic CRC. When NVMAUTOCRC is 1 then the EEPROM Stored CRC byte is automatically calculated whenever an EEPROM program takes place.
[3]	NVMCOMMIT	RWSC	0	N	NVM Commit to Registers. The NVMCOMMIT bit is used to initiate a transfer of the on-chip EEPROM contents to internal registers. The transfer happens automatically after reset or when NVMCOMMIT is set to 1. The NVMCOMMIT bit is automatically cleared to 0. The I ² C registers cannot be read while a NVM Commit operation is taking place. The NVMCOMMIT operation can only be carried out when the Always On Clock is active. The Always On Clock can be kept running after lock by setting the AONAFTERLOCK bit.
[2]	NVMBUSY	R	0	N	NVM Program Busy Indication. The NVMBUSY bit is 1 during an on-chip EEPROM Erase/Program cycle. While NVMBUSY is 1 the on-chip EEPROM cannot be accessed.
[1]	RSRVD	RWSC	0	N	Reserved.
[0]	NVMPROG	RWSC	0	N	NVM Program Start. The NVMPROG bit is used to begin an on-chip EEPROM Erase/Program cycle. The Erase/Program cycle is only initiated if the immediately preceding I ² C transaction was a write to the NVMUNLK register with the appropriate code. The NVMPROG bit is automatically cleared to 0. The NVM Erase/Program operation takes around 230-ms.

9.6.114 NVMLCRC Register; R138

The NVMLCRC register holds the Live CRC byte that has been calculated while reading on-chip EEPROM.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	NVMLCRC[7:0]	R	0x0	N	NVM Live CRC.

9.6.115 MEMADR_BY1 Register; R139

The MEMADR_BY1 register holds the MSB of the starting address for on-chip SRAM or EEPROM access.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:0]	MEMADR[11:8]	RW	0x0	N	Memory Address. The MEMADR value determines the starting address for access to the on-chip memories. The on-chip memories and the corresponding address ranges are listed below. The data from the selected address is then accessed using one of the data registers listed below.
					MEMORY
					MEMADR Range
					Data Register
					NVM EEPROM-Array
					MEMADR[8:0]
					NVMDAT
					NVM SRAM-Array
					MEMADR[8:0]
					RAMDAT
					ROM-Array
					MEMADR[11:0]
					ROMDAT

9.6.116 MEMADR_BY0 Register; R140

The MEMADR_BY0 register holds the lower 8-bits of the starting address for on-chip SRAM or EEPROM access.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	MEMADR[7:0]	RW	0x0	N	Memory Address.

9.6.117 NVMDAT Register; R141

The NVMDAT register returns the on-chip EEPROM contents from the starting address specified by the MEMADR register.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	NVMDAT[7:0]	R	0x0	N	EEPROM Read Data. The first time an I ² C read transaction accesses the NVMDAT register address, either because it was explicitly targeted or because the address was auto-incremented, the read transaction will return the EEPROM data located at the address specified by the MEMADR register. Any additional read's which are part of the same transaction will cause the EEPROM address to be incremented and the next EEPROM data byte will be returned. The I ² C address will no longer be auto-incremented, i.e the I ² C address will be locked to the NVMDAT register after the first access. Access to the NVMDAT register will terminate at the end of the current I ² C transaction.

9.6.118 RAMDAT Register; R142

The RAMDAT register provides read and write access to the SRAM that forms part of the on-chip EEPROM module.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	RAMDAT[7:0]	RW	0x0	N	RAM Read/Write Data. The first time an I ² C read or write transaction accesses the RAMDAT register address, either because it was explicitly targeted or because the address was auto-incremented, a read transaction will return the RAM data located at the address specified by the MEMADR register and a write transaction will cause the current I ² C data to be written to the address specified by the MEMADR register. Any additional accesses which are part of the same transaction will cause the RAM address to be incremented and a read or write access will take place to the next SRAM address. The I ² C address will no longer be auto-incremented, i.e the I ² C address will be locked to the RAMDAT register after the first access. Access to the RAMDAT register will terminate at the end of the current I ² Cs transaction.

9.6.119 ROMDAT Register; R143

The romdat register provides read to the on-chip ROM module.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	ROMDAT[7:0]	R	0x0	N	ROM Read Data. The first time an I ² C read or write transaction accesses the romdat register address, either because it was explicitly targeted or because the address was auto-incremented, a read transaction will return the ROM data located at the address specified by the MEMADR register. Any additional accesses which are part of the same transaction will cause the ROM address to be incremented and a read access will take place to the next ROM address. The I ² C address will no longer be auto-incremented, i.e the I ² C address will be locked to the romdat register after the first access. Access to the ROMDAT register will terminate at the end of the current I ² C transaction.

9.6.120 NVMUNLK Register; R144

The NVMUNLK register provides a rudimentary level of protection to prevent inadvertent programming of the on-chip EEPROM.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	NVMUNLK[7:0]	RW	0x0	N	NVM Prog Unlock. The NVMUNLK register must be written immediately prior to setting the NVMPROG bit of register NVMCTL, otherwise the Erase/Program cycle will not be triggered. NVMUNLK must be written with a value of 0xEA.

9.6.121 REGCOMMIT_PAGE Register; R145

The REGCOMMIT_PAGE register determines the region of the EEPROM/SRAM array that is populated by the REGCOMMIT operation.

Bit #	Field	Type	Reset	NVM	Description
[7:4]	RSRVD	-	-	N	Reserved.
[3:0]	REGCOMMIT_PG[3:0]	RW	0x0	N	Register Commit Page (1 of 6 available pages that can be selected by the GPIO[3:2] pins for default powerup state. NOTE: Valid page values are 0 to 5. Do not use other values.)

9.6.122 XOCAPCTRL_BY1 Register; R199

The XOCAPCTRL_BY1 and XOCAPCTRL_BY0 registers allow read-back of the XOCAPCTRL value that displays the on-chip load capacitance selected for the crystal.

Bit #	Field	Type	Reset	NVM	Description
[7:2]	RSRVD	-	-	N	Reserved.
[1:0]	XO_CAP_CTRL L[9:8]	R	0x0	N	XO CAP CTRL register.

9.6.123 XOCAPCTRL_BY0 Register; R200

The XOCAPCTRL_BY1 and XOCAPCTRL_BY0 registers allow read-back of the XOCAPCTRL value that displays the on-chip load capacitance selected for the crystal.

Bit #	Field	Type	Reset	NVM	Description
[7:0]	XO_CAP_CTRL L[7:0]	R	0x0	N	XO CAP CTRL register.

9.7 EEPROM Map

The EEPROM map is shown in the table below. There are 6 EEPROM pages and the common EEPROM bits are shown first.

Byte #	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.2 Jitter Considerations in Serdes Systems

Jitter-sensitive applications such as 10-Gbps or 100-Gbps Ethernet, deploy a serial link utilizing a Serializer in the transmit section (TX) and a De-serializer in the receive section (RX). These SERDES blocks are typically embedded in an ASIC or FPGA. Estimating the clock jitter impact on the link budget requires understanding of the TX PLL bandwidth and the RX CDR bandwidth.

As can be seen in Figure 82, the pass band region between the TX low pass cutoff and RX high pass cutoff frequencies is the range over which the reference clock jitter adds without any attenuation to the jitter budget of the link. Outside of these frequencies, the SERDES link will attenuate the reference clock jitter with a 20-dB/dec or even steeper roll-off. Modern ASIC or FPGA designs have some flexibility on deciding the optimal RX CDR bandwidth and TX PLL bandwidth. These bandwidths are typically set based on what is achievable in the ASIC or FPGA process node, without increasing design complexity, and on any jitter tolerance or wander specification that needs to be met, as related to the RX CDR bandwidth.

The overall allowable jitter in a serial link is dictated by IEEE or other relevant standards. For example, IEEE802.3ba states that the maximum transmit jitter (peak-peak) for 10-Gbps Ethernet should be no more than $0.28 * UI$ and this equates to a 27.1516-ps, p-p for the overall allowable transmit jitter.

Jitter Considerations in Serdes Systems (continued)

The jitter contributing elements are made up of the reference clock, generated potentially from a device like LMK03328, the transmit medium, transmit driver etc. Only a portion of the overall allowable transmit jitter is allocated to the reference clock, typically 20% or lower. Therefore, the allowable reference clock jitter, for a 20% clock jitter budget, is 5.43-ps, p-p.

Jitter in a reference clock is made up of deterministic jitter (arising from spurious signals due to supply noise or mixing from other outputs or from the reference input) and random jitter (usually due to thermal noise and other uncorrelated noise sources). A typical clock tree in a serial link system consists of clock generators and fanout buffers. The allowable reference clock jitter of 5.43-ps, p-p is needed at the output of the fanout buffer. Modern fanout buffers have low additive random jitter (less than 100-fs, rms) with no substantial contribution to the deterministic jitter. Therefore, the clock generator and fanout buffer contribute to the random jitter while the primary contributor to the deterministic jitter is the clock generator. Rule of thumb, for modern clock generators, is to allocate 25% of allowable reference clock jitter to the deterministic jitter and 75% to the random jitter. This amounts to an allowable deterministic jitter of 1.36-ps, p-p and an allowable random jitter of 4.07-ps, p-p. For serial link systems that need to meet a BER of 10^{-12} , the allowable random jitter in root-mean-square is 0.29-ps, rms. This is calculated by dividing the p-p jitter by 14 for a BER of 10^{-12} . Accounting for random jitter from the fanout buffer, the random jitter needed from the clock generator is 0.27-ps, rms. This is calculated by the root-mean-square subtraction from the desired jitter at the fanout buffer's output assuming 100-fs, rms of additive jitter from the fanout buffer.

With careful frequency planning techniques, like spur optimization (covered in the [Spur Mitigation Techniques](#) section) and on-chip LDOs to suppress supply noise, the LMK03328 is able to generate clock outputs with deterministic jitter that is below 1-ps, p-p and random jitter that is below 0.2-ps, rms. This gives the serial link system with additional margin on the allowable transmit jitter resulting in a BER better than 10^{-12} .

Jitter Considerations in Serdes Systems (continued)

Figure 82. Dependence of Clock Jitter in Serial Links

10.3 Frequency Margining

10.3.1 Fine Frequency Margining

IEEE802.3 dictates that Ethernet frames stay compliant to the standard specifications when clocked with a reference clock that is within ± 100 -ppm of its nominal frequency. In the worst case, an RX node with its local reference clock at -100 -ppm from its nominal frequency should be able to work seamlessly with a TX node that has its own local reference clock at $+100$ -ppm from its nominal frequency. Without any clock compensation on the RX node, the read pointer will severely lag behind the write pointer and cause FIFO overflow errors. On the contrary, when the RX node's local clock operates at $+100$ -ppm from its nominal frequency and the TX node's local clock operates at -100 -ppm from its nominal frequency, FIFO underflow errors occur without any clock compensation.

In order to prevent such overflow and underflow errors from occurring, modern ASICs and FPGAs include a clock compensation scheme that introduces elastic buffers. Such a system, shown in Figure 82, is validated thoroughly during the validation phase by interfacing slower nodes with faster ones and ensuring compliance to IEEE802.3. The LMK03328 provides the ability to fine tune the frequency of its outputs based on changing its on-chip load capacitance when operated with a crystal input. This fine tuning can be done via I2C or via the GPIO5 pin as described in the "Crystal Input Interface" sub-section. A total of ± 50 -ppm frequency tuning is achievable when using pullable crystals whose C0/C1 ratio is less than 250. The change in load capacitance is implemented in a manner such that the LMK03328's outputs undergo a smooth monotonic change in frequency.

10.3.2 Coarse Frequency Margining

Certain systems require the processors to be tested at clock frequencies that are slower or faster by 5% or 10%. The LMK03328 offers the ability to change its output dividers for the desired change from its nominal output frequency without resulting in any glitches (as explained in the "High-Speed Output Dividers" sub-section).

Figure 83. System Implementation with Clock Compensation for Standards Compliance

10.4 Design Requirements

Consider a typical wired communications application, like a top-of-rack switch, which needs to clock high data rate 10-Gbps or 100-Gbps Ethernet PHYs and other macros like PCI Express, DDR and CPLD. For such asynchronous systems, the reference input can be a crystal. In such systems, the clocks are expected to be available upon powerup without the need for any device-level programming. An example of clock input and output requirements is shown below:

- Clock Input:
 - 25-MHz crystal
- Clock Outputs:
 - 2x 156.25-MHz clock for uplink 10.3125-Gbps, LVPECL
 - 2x 125-MHz clock for downlink 3.125-Gbps, LVPECL
 - 2x 100-MHz clock for PCI Express, HCSL
 - 1x 133.3333-MHz clock for DDR, LVDS
 - 2x 66.6667-MHz clock for CPLD, 1.8-V LVCMOS

The section below describes the detailed design procedure to generate the required output frequencies for the above scenario using LMK03328.

10.4.1 Detailed Design Procedure

Design of all aspects of the LMK03328 is quite involved and software support is available to assist in part selection, part programming, loop filter design, and phase noise simulation. This design procedure will give a quick outline of the process.

1. Device Selection
 - The first step to calculate the specified VCO frequency given required output frequencies. The device must be able to produce the VCO frequency that can be divided down to the required output frequencies.
 - The WEBENCH Clock Architect Tool from TI will aid in the selection of the right device that meets the customer's output frequencies and format requirements.
2. Device Configuration
 - There are many device configurations to achieve the desired output frequencies from a device. However there are some optimizations and trade-offs to be considered.
 - The WEBENCH Clock Architect Tool attempts to maximize the phase detector frequency, use smallest dividers, and maximizes PLL charge pump current.
 - The software attempts to use fewer frequency domains where each domain corresponds to an individual PLL.

NOTE

The LMK03328 incorporates 2 PLLs and can support two frequency domains.

- These guidelines below may be followed when configuring PLL related dividers or other related registers:
 - For lowest possible in-band PLL flat noise, maximize phase detector frequency to minimize N divide value.
 - For lowest possible in-band PLL flat noise, maximize charge pump current. The highest value charge pump currents often have similar performance due to diminishing returns.
 - To reduce loop filter component sizes, increase N value and/or reduce charge pump current.
 - To minimize cross coupling between the VCOs of each PLL, it is best to keep large enough frequency separation between them. For most application use cases, there are 2 or more VCO frequencies that can result in the same output frequencies by changing the output divider, PLL post divider and PLL N divider.
 - For fractional divider values, keep the denominator at highest value possible in order to minimize spurs. It is also best to use higher order modulator wherever possible for the same reason.
 - As a rule of thumb, keeping the phase detector frequency approximately between $10 \times$ PLL loop bandwidth and $100 \times$ PLL loop bandwidth. A phase detector frequency less than $5 \times$ PLL bandwidth may be unstable and a phase detector frequency $> 100 \times$ loop bandwidth may experience increased lock time due to cycle slipping.

Design Requirements (continued)

3. PLL Loop Filter Design

- It is recommended to use the WEBENCH Clock Architect Tool to design your loop filter.
- Optimal loop filter design and simulation can be achieved when custom reference phase noise profiles are loaded into the software tool.
- While designing the loop filter, adjusting the charge pump current or N value can help with loop filter component selection. Lower charge pump currents and larger N values result in smaller component values but may increase impacts of leakage and reduce PLL phase noise performance.
- For a more detailed understanding of loop filter design can be found in Dean Banerjee's *PLL Performance, Simulation, and Design* (www.ti.com/tool/pll_book).

4. Clock Output Assignment

- At the time of writing this datasheet, the design software does not take into account frequency assignment to specific outputs except to ensure that the output frequencies can be achieved. It is best to consider proximity of the clock outputs to each other and other PLL circuitry when choosing final clock output locations. Here are some guidelines to help achieve optimal performance when assigning outputs to specific clock output pins.
 - Group common frequencies together.
 - PLL charge pump circuitry can cause crosstalk at the charge pump frequency. Place outputs sharing charge pump frequency or lower priority outputs not sensitive to charge pump frequency spurs together.
 - Keep frequency separation between VCOs as high as possible for minimum cross coupling.
 - For minimizing cross coupling between the PLLs, consider routing PLL2 to any of outputs 0, 1, 2, 3 and routing PLL1 to any of outputs 4, 5, 6, 7.
 - Clock output MUXes can create a path for noise coupling. Factor in frequencies which may have some bleedthrough from non-selected mux inputs.
 - If possible, use outputs 0, 1, 2 or 3 since they don't have MUX in the clock path and have limited opportunity for cross coupled noise.

5. Device Programming

- The EVM programming software tool CodeLoader can be used to program the device with the desired configuration.

10.4.1.1 Device Selection

Use the WEBENCH Clock Architect Tool. Enter the required frequencies and formats into the tool. To use this device, find a solution using the LMK03328.

10.4.1.1.1 Calculation Using LCM

In this example, the $\text{LCM}(156.25\text{-MHz}, 125\text{-MHz}) = 625\text{-MHz}$ and the $\text{LCM}(100\text{-MHz}, 133.33\text{-MHz}, 66.66\text{-MHz}) = 400\text{-MHz}$. It can be deduced that both PLLs need to be utilized to generate the required output frequencies. Valid VCO frequencies for LMK03328 are 5-GHz (625×8) and 4.8-GHz (400×12).

10.4.1.2 Device Configuration

For this example, when using the WEBENCH Clock Architect Tool, the reference would have been manually entered as 25-MHz according to input frequency requirements. Enter the desired output frequencies and click on 'Generate Solutions'. Select LMK03328 from the solution list.

From the simulation page of the WEBENCH Clock Architect Tool, it can be seen that to maximize phase detector frequencies, PLL1 and PLL2 R and M dividers are set to 1, doublers are enabled and N1 divider is set to 200 and N2 divider is set to 192. This results in a VCO1 frequency of 5-GHz and VCO2 frequency of 4.8-GHz. The tool also tries to select maximum possible value for the PLL post dividers and for this example, the post divider for each PLL is set to 8. At this point the design meets all input and output frequency requirements and it is possible to design a loop filter for system and simulate performance on the clock outputs. However, consider also the following:

- At the time of release of this datasheet, the WEBENCH Clock Architect Tool doesn't assign outputs strategically for minimizing cross-coupled spurs and jitter.

Design Requirements (continued)

10.4.1.3 PLL Loop Filter Design

The WEBENCH Clock Architect Tool allows loading a custom phase noise plot for reference inputs. For improved accuracy in simulation and optimum loop filter design, be sure to load these custom noise profiles. After loading a phase noise plot, user should recalculate the recommended loop filter design. The WEBENCH Clock Architect Tool will return solutions with high reference/phase detector frequencies by default. In the WEBENCH Clock Architect Tool the user may increase the reference divider to reduce the frequency if desired.

The next section will discuss PLL loop filter design specific to this example using default phase noise profiles.

NOTE

The WEBENCH Clock Architect Tool provides optimal loop filters upon selecting a solution from the solution list to simulate for the first time. Anytime PLL related inputs change, like input phase noise, charge pump current, divider values, and so forth, it is best to use the tool to re-calculate the optimal loop filter component values.

10.4.1.3.1 PLL Loop Filter Design

In the WEBENCH Clock Architect Tool simulator, click on the PLL1 or PLL2 loop filter design button, then press recommend design. For each PLL's loop filter, maximum phase detector frequency and maximum charge pump current are typically used. The tool recommends a loop filter that is designed to minimize jitter. The integrated loop filters' components are minimized with this recommendation as to allow maximum flexibility in achieving wide loop bandwidths for low PLL noise. With the recommended loop filter calculated, this loop filter is ready to be simulated.

Each PLL loop filter's bode plot can additionally be viewed and adjustments can be made to the integrated components. The effective loop bandwidth and phase margin with the updated values is then calculated. The integrated loop filter components are good to use when attempting to eliminate certain spurs. The recommended procedure is to increase C3 capacitance, then R3 resistance. Large R3 resistance can result in degraded VCO phase noise performance.

10.4.1.4 PLL and Clock Output Assignment

At this time the WEBENCH Clock Architect Tool does not assign output frequencies to specific output ports on the device with the intention to minimize cross-coupled spurs and jitter. The user may wish to make some educated re-assignment of outputs when using the EVM programming tool to configure the device registers appropriately.

In an effort to optimize device configuration for best jitter performance, following guidelines should be considered:

- Since the clock outputs, intended to be used to clock high data rates, are needed with lowest possible jitter, it is best to assign 156.25-MHz to outputs 0, 1 and assign 125-MHz to outputs 2, 3.
- To minimize cross coupling between PLLs, select PLL2 VCO to operate at 5-GHz and PLL1 VCO to operate 4.8-GHz.
- Coupling between outputs at different frequencies appear as spurs at offsets that is at the frequency difference between the outputs and its harmonics. Typical SerDes reference clocks need to have low integrated jitter upto an offset of 20-MHz and thus, to minimize cross coupling between output 3 and output 4, it is best to assign 100-MHz to outputs 4 and 5.
- The 133.3333-MHz can then be assigned to output 6.
- The 1.8-V LVCMOS clock at 66.6667-MHz is assigned to output 7 and it is best to select complementary LVCMOS operation. This helps to minimize coupling from this output channel to other outputs.

10.5 Spur Mitigation Techniques

The LMK03328 offers several programmable features for optimizing fractional spurs. In order to get the best out of these features, it makes sense to understand the different kinds of spurs as well as their behaviors, causes, and remedies. Although optimizing spurs may involve some trial and error, there are ways to make this process more systematic.

Spur Mitigation Techniques (continued)

10.5.1 Phase Detector Spurs

The phase detector spur occurs at an offset from the carrier equal to the phase detector frequency, f_{PD} . To minimize this spur, a lower phase detector frequency should be considered. In some cases where the loop bandwidth is very wide relative to the phase detector frequency, some benefit might be gained from using a narrower loop bandwidth or adding poles to the loop filter by using R3 and C3 if previously unused, but otherwise the loop filter has minimal impact. Bypassing at the supply pins and board layout can also have an impact on this spur, especially at higher phase detector frequencies.

10.5.2 Integer Boundary Fractional Spurs

This spur occurs at an offset equal to the difference between the VCO frequency and the closest integer channel for the VCO. For instance, if the phase detector frequency is 100-MHz and the VCO frequency is 5003-MHz, then the integer boundary spur would be at 3-MHz offset. This spur can be either PLL or VCO dominated. If it is PLL dominated, decreasing the loop bandwidth and some of the programmable fractional words may impact this spur. If the spur is VCO dominated, then reducing the loop filter will not help, but rather reducing the phase detector and having good slew rate and signal integrity at the selected reference input will help.

10.5.3 Primary Fractional Spurs

These spurs occur at multiples of f_{PD}/DEN and are not integer boundary spurs. For instance, if the phase detector frequency is 100-MHz and the fraction is 3/100, the primary fractional spurs would be at 1-MHz, 2-MHz, 4-MHz, 5-MHz, 6-MHz etc. These are impacted by the loop filter bandwidth and modulator order. If a small frequency error is acceptable, then a larger equivalent fraction may improve these spurs. This larger unequivalent fraction pushes the fractional spur energy to much lower frequencies where they do not significantly impact the system performance.

10.5.4 Sub-Fractional Spurs

These spurs appear at a fraction of f_{PD}/DEN and depend on modulator order. With the first order modulator, there are no sub-fractional spurs. The second order modulator can produce 1/2 sub-fractional spurs if the denominator is even. A third order modulator can produce sub-fractional spurs at 1/2, 1/3, or 1/6 of the offset, depending if it is divisible by 2 or 3. For instance, if the phase detector frequency is 100-MHz and the fraction is 3/100, no sub-fractional spurs for a first order modulator or sub-fractional spurs at multiples of 1.5-MHz for a second or third order modulator would be expected. Aside from strategically choosing the fractional denominator and using a lower order modulator, another tactic to eliminate these spurs is to use dithering and express the fraction in larger equivalent terms. Since dithering also adds phase noise, its level needs to be managed to achieve acceptable phase noise and spurious performance.

[Table 18](#) gives a summary of the spurs discussed so far and techniques to mitigate them.

Table 18. Spurs and Mitigation Techniques

SPUR TYPE	OFFSET	WAYS TO REDUCE	TRADE-OFFS
Phase Detector	f_{PD}	Reduce Phase Detector Frequency.	Although reducing the phase detector frequency does improve this spur, it also degrades phase noise.

Spur Mitigation Techniques (continued)

Table 18. Spurs and Mitigation Techniques (continued)

SPUR TYPE	OFFSET	WAYS TO REDUCE	TRADE-OFFS
Integer Boundary	$f_{VCO} \bmod f_{PD}$	Methods for PLL Dominated Spurs -Avoid the worst case VCO frequencies if possible. -Ensure good slew rate and signal integrity at reference input. -Reduce loop bandwidth or add more filter poles to suppress out of band spurs.	Reducing the loop bandwidth may degrade the total integrated noise if the bandwidth is too narrow.
		Methods for VCO Dominated Spurs -Avoid the worst case VCO frequencies if possible. -Reduce Phase Detector Frequency. -Ensure good slew rate and signal integrity at reference input.	Reducing the phase detector may degrade the phase noise.
Primary Fractional	f_{PD}/DEN	-Decrease Loop Bandwidth. -Change Modulator Order. -Use Larger Unequivalent Fractions.	Decreasing the loop bandwidth may degrade in-band phase noise. Also, larger unequivalent fractions don't always reduce spurs.
Sub-Fractional	$f_{PD}/DEN/k$ k=2,3, or 6	-Use Dithering. -Use Larger Equivalent Fractions. -Use Larger Unequivalent Fractions. -Reduce Modulator Order. -Eliminate factors of 2 or 3 in denominator.	Dithering and larger fractions may increase phase noise.

11 Power Supply Recommendations

11.1 Device Power Up Sequence

Figure 84 shows the power up sequence of the LMK03328 in both the hard pin mode and soft pin mode. In the event of device power up from ROM or EEPROM, it is recommended to lock one of the PLLs before the other (for cases where both PLLs are utilized to generate the required output frequencies) to avoid any injection locking issues in case both VCOs operate in close vicinity.

Figure 84. Flow Chart for Device Power Up and Configuration

11.2 Device Power Up Timing

Before the outputs are enabled after power up, the LMK03328 goes through the initialization routine given in [Table 19](#).

Table 19. LMK03328 Power Up Initialization Routine

Parameter	Definition	Duration	Comments
T_{PWR}	Step 1: Power up ramp	Depends on customer supply ramp time	The POR monitor holds the device in power-down/reset until the VDD supply voltage reaches 2.72-V (min) to 2.95-V (max) and VDDO_01 reaches 1.7-V (min).
T_{XO}	Step 2: XO startup (if crystal is used)	Depends on XTAL. Could be several ms; For TXC 25-MHz typical XTAL startup time measures 100-us.	This step assumes PDN=1. The XTAL startup time is the time it takes for the XTAL to oscillate with sufficient amplitude. The LMK03328 has a built-in amplitude detection circuit, and halts the PLL lock sequence until the XTAL stage has sufficient swing.
$T_{CAL-PLL1}$	Step 3: Closed loop calibration period for PLL1	Programmable cycles of internal 10-MHz oscillator.	This counter is needed for the PLL1 loop to stabilize. The duration can range from 30-us to 300-ms. Recommended duration for PLL1 as clock generator (loop bandwidth > 10-kHz) is 300-us and for PLL1 as jitter cleaner (loop bandwidth < 1-kHz) is 300-ms.
T_{VCO1}	Step 4: VCO1 wait period	Programmable cycles of internal 10-MHz oscillator.	This counter is needed for the VCO1 to stabilize. The duration can range from 20-us to 200-ms. Recommended duration for VCO1 is 400-us.
$T_{LOCK-PLL1}$	Step 5: PLL1 lock time	~4/LBW of PLL1	The Outputs turn on immediately after calibration. A small frequency error remains for the duration of ~4/LBW (so in clock generator mode typically 10-us for a PLL bandwidth of 400-kHz). The initial output frequency will be lower than the target output frequency, as the loop filter starts out initially discharged.
$T_{LOL-PLL1}$	Step 6: PLL1 LOL indicator low	~1 PFD clock cycle	The PLL1 loss of lock indicator if selected on STATUS0 or STATUS1 will go low after 1 PFD clock cycle to indicate PLL1 is now locked.
$T_{CAL-PLL2}$	Step 7: Closed loop calibration period for PLL2	Programmable cycles of internal 10-MHz oscillator.	This counter is needed for the PLL2 loop to stabilize. The duration can range from 30-us to 300-ms. Recommended duration for PLL2 as clock generator (loop bandwidth > 10-kHz) is 300-us and for PLL2 as jitter cleaner (loop bandwidth < 1-kHz) is 300-ms.
T_{VCO2}	Step 8: VCO2 wait period	Programmable cycles of internal 10-MHz oscillator.	This counter is needed for the VCO2 to stabilize. The duration can range from 20-us to 200-ms. Recommended duration for VCO2 is 400-us.
$T_{LOCK-PLL2}$	Step 9: PLL2 lock time	~4/LBW of PLL2	The Outputs turn on immediately after calibration. A small frequency error remains for the duration of ~4/LBW (so in clock generator mode typically 10-us for a PLL bandwidth of 400-kHz). The initial output frequency will be lower than the target output frequency, as the loop filter starts out initially discharged.
$T_{LOL-PLL2}$	Step 10: PLL2 LOL indicator low	~1 PFD clock cycle	The PLL2 loss of lock indicator if selected on STATUS0 or STATUS1 will go low after 1 PFD clock cycle to indicate PLL2 is now locked.

The LMK03328 startup time for PLL1 or PLL2 is defined as the time taken, from the moment the core supplies reach 3.135-V and the VDDO_01 reaches 1.7-V, for either PLL to be locked and valid outputs are available at the outputs with no more than +/- 300-ppm error. Startup time for PLL1 can be calculated as

$$T_{PLL1-SU} = T_{XO} + T_{CAL-PLL1} + T_{VCO1} + T_{LOCK-PLL1} \quad (5)$$

When R12.1 = "0", startup time for PLL2 can be calculated as

$$T_{PLL2-SU} = T_{PLL1-SU} + T_{CAL-PLL2} + T_{VCO2} + T_{LOCK-PLL2} \quad (6)$$

When R12.1 = "1", startup time for PLL2 can be calculated as

$$T_{PLL2-SU} = T_{XO} + T_{CAL-PLL2} + T_{VCO2} + T_{LOCK-PLL2} \quad (7)$$

11.3 Power Down

The PDN pin (active low) can be used both as device power-down pin and to initialize the device. When this pin is pulled low, the entire device is powered down. When it is pulled high, the power-on/reset (POR) sequence is triggered and causes all registers to be set to an initial state. The initial state is determined by the device control pins as described in the [Device Configuration Control](#) section. When PDN is pulled low, I²C is disabled. When PDN is pulled high, the device power-up sequence is initiated as described in [Device Power Up Sequence](#) and [Device Power Up Timing](#).

Table 20. PDN Control

PDN Pin State	Device operation
0	Device is disabled
1	Normal operation

11.4 Power Rail Sequencing, Power Supply Ramp Rate, and Mixing Supply Domains

11.4.1 Mixing Supplies

The LMK03328 incorporates flexible power supply architecture. While the VDD_IN, VDD_PLL1, VDD_PLL2 and VDD_DIG supplies have to be driven by the same 3.3-V supply rail, the individual VDDO_x supplies can be driven from separate 1.8-V, 2.5-V or 3.3-V supply rails. Lowest power consumption can be realized by operating the VDD_IN, VDD_PLL1, VDD_PLL2 and VDD_DIG supplies from a 3.3-V rail and the VDDO_x supplies from a 1.8-V rail.

11.4.2 Power-On Reset

The LMK03328 integrates a built-in POR circuit, that holds the device in reset until: a) the VDD_IN, VDD_PLL1, VDD_PLL2, and VDD_DIG supplies have reached at least 2.72-V, and b) the VDDO_01 supply has reach at least 1.7-V. After this power-on release, device internal counters start (see previous section on device power up timing) followed by device calibration. While the device digital circuit resets properly at this supply voltage level, the device's analog core supplies are not sufficiently high enough to ensure proper calibration until these supplies have settled within their respective operating voltage tolerances of ±5%. For very slow power up ramps beyond ~ 100-ms, the internal counter could expire before the supply voltage reaches the minimum voltage of 3.135-V. In this scenario, it would be necessary to delay calibration further using the PDN input.

11.4.3 Slow Power-Up Supply Ramp

It is necessary to ensure that device calibration occurs AFTER the VDD_IN, VDD_PLL1, VDD_PLL2, and VDD_DIG, and VDDO_01 supplies have settled within their respective operating voltage tolerances of ±5%. This can be realized by delaying the PDN low-to-high transition. The PDN input incorporates a 200-kohm resistor to VDDO_01. Assuming the VDD_IN, VDD_PLL1, VDD_PLL2 and VDD_DIG supplies are derived from a single 3.3-V supply rail and VDDO_01 is derived from a separate 1.8-V rail which is ramped later (ie.g. violating the 100-ms maximum supply ramp time), then a capacitor from the PDN pin to GND can be used to form a R-C time constant with the internal 200-kohm pull-up resistor. This R-C time constant can be designed to delay the low-to-high transition of PDN, until after all supplies to settle within their respective voltage tolerances. If however the VDDO_01 supply ramps much sooner than the VDD_IN, VDD_PLL1, VDD_PLL2 and VDD_DIG supplies, additional means are necessary to prevent PDN from toggling too early. A premature release of PDN would possibly result in failed PLL calibration, which can only be corrected by re-calibrating the PLL by either toggling PDN or programming the software reset (R12.7).

Power Rail Sequencing, Power Supply Ramp Rate, and Mixing Supply Domains (continued)

Figure 85. PDN Delay when Using Slow Ramping Power Supplies (Supply Ramp > 100-ms)

11.4.4 Fast Power-Up Supply Ramp

If the V_{DD_IN} , V_{DD_PLL1} , V_{DD_PLL2} , and V_{DD_DIG} , and V_{DDO_01} supplies ramp within their respective operating voltage tolerances of $\pm 5\%$ in less than 100-ms, then there is no requirement to add a capacitor on the PDN pin to externally delay the device power-up sequence. The PDN pin can be left floating, or otherwise driven by a host controller for meeting the clock sequencing requirements in the system, for example.

12 Layout

12.1 Layout Guidelines

The following section provides the layout guidelines to ensure good thermal performance and power supply connections for the LMK03328.

12.1.1 Guarantee Thermal Reliability

The LMK03328 is a high performance device. Therefore careful attention must be paid to device configuration and printed circuit board (PCB) layout with respect to device power consumption and thermal considerations. Employing a thermally-enhanced PCB layout can insure good thermal dissipation from the device to the PCB layers. Observing good thermal layout practices enables the thermal slug, or die attach pad (DAP), on the bottom of the QFN-48 package to provide a good thermal path between the die contained within the package and the ambient air through the PCB interface. This thermal pad also serves as the singular ground connection the device; therefore, a low inductance connection to multiple PCB ground layers (both internal and external) is essential.

[Figure 86](#) shows a PCB layout example showing the application of thermal design practices and low-inductance ground connection between the device DAP and the PCB. Connecting a 6 x 6 thermal via pattern and using multiple PCB ground layers (e.g. 8- or 10-layer PCB) can help to reduce the junction-to-ambient thermal resistance, as indicated in the [Thermal Information](#) section. The 6×6 filled via pattern facilitates both considerations.

Layout Guidelines (continued)

Figure 86. 4-Layer PCB Thermal Layout Example for LMK03328 (8+ Layers Recommended)

Layout Guidelines (continued)

12.1.2 Layout Example

Figure 87. Conceptual Placement of Power Supply Bypass Capacitors (NOT Representative of LMK03328 Supply Pin Locations)

12.1.3 Power Supply Bypassing

[Figure 87](#) shows two conceptual layouts detailing recommended placement of power supply bypass capacitors. If the capacitors are mounted on the back side, 0402 components can be employed; however, soldering to the Thermal Dissipation Pad can be difficult. For component side mounting, use 0201 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low impedance connection to the ground plane.

13 Device and Documentation Support

13.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

13.2 Trademarks

E2E is a trademark of Texas Instruments.

13.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

13.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMK03328RHSR	ACTIVE	WQFN	RHS	48	2500	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	K03328A	Samples
LMK03328RHST	ACTIVE	WQFN	RHS	48	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	K03328A	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
