

Low-Noise, Low Quiescent Current, Precision Operational Amplifier *e-trim*[™] Series

Check for Samples: [OPA376-Q1](#), [OPA2376-Q1](#), [OPA4376-Q1](#)

FEATURES

- Qualified for Automotive Applications
- Low Noise: $7.5\text{nV}/\sqrt{\text{Hz}}$ at 1kHz
- 0.1Hz TO 10Hz Noise: $0.8\mu\text{V}_{\text{PP}}$
- Quiescent Current: $760\mu\text{V}$ (typ)
- Low Offset Voltage: $5\mu\text{V}$ (typ)
- Gain Bandwidth Product: 5.5MHz
- Rail-to-Rail Output
- Single-Supply Operation
- Supply Voltage: 2.2V to 5.5V
- Space-Saving Packages:
 - SC-70, SOT23, MSOP, TSSOP

APPLICATIONS

- ADC Buffer
- Audio Equipment
- Medical Instrumentation
- Handheld Test Equipment
- Active Filtering
- Sensor Signal Conditioning

DESCRIPTION

The OPA376-Q1 family represent a new generation of low-noise operational amplifiers with *e-trim*, offering outstanding dc precision and ac performance. Rail-to-rail output, low offset ($25\mu\text{V}$ max), low noise ($7.5\text{nV}/\sqrt{\text{Hz}}$), quiescent current of $950\mu\text{A}$ max, and a 5.5MHz bandwidth make this part very attractive for a variety of precision and portable applications. In addition, this device has a reasonably wide supply range with excellent PSRR, making it attractive for applications that run directly from batteries without regulation.

The OPA376-Q1 (single version) is available in MicroSIZE SC70-5, SOT23-5, and SO-8 packages. The OPA2376-Q1 (dual) is offered in the SO-8 package. The OPA4376-Q1 (quad) is offered in a TSSOP-14 package. All versions are specified for operation from -40°C to 125°C .

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

e-trim is a trademark of Texas Instruments Incorporated.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATING⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		VALUE	UNIT
Supply voltage	$V_S = (V+) - (V-)$	+7	V
Signal input terminals	Voltage ⁽²⁾	(V-) – 0.5 to (V+) + 0.5	V
	Current ⁽²⁾	±10	mA
Output short-circuit ⁽³⁾		Continuous	
Operating temperature	T_A	–40 to +125	°C
Storage temperature	T_A	–65 to +150	°C
Junction temperature	T_J	+150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.
- (2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current limited to 10mA or less.
- (3) Short-circuit to ground, one amplifier per package.

APPLICATION INFORMATION

The OPA376-Q1 family of operational amplifiers is built using *e-trim*, a proprietary technique in which offset voltage is adjusted during the final steps of manufacturing. This technique compensates for performance shifts that can occur during the molding process. Through *e-trim*, the OPA376-Q1 family delivers excellent offset voltage (5 μ V, typ). Additionally, the amplifier boasts a fast slew rate, low drift, low noise, and excellent PSRR and A_{OL} . These 5.5MHz CMOS op amps operate on 760 μ A (typ) quiescent current.

OPERATING CHARACTERISTICS

The OPA376-Q1 family of amplifiers has parameters that are fully specified from 2.2V to 5.5V (± 1.1 V to ± 2.75 V). Many of the specifications apply from -40°C to $+125^{\circ}\text{C}$. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Typical Characteristics](#).

GENERAL LAYOUT GUIDELINES

For best operational performance of the device, good printed circuit board (PCB) layout practices are required. Low-loss, 0.1 μ F bypass capacitors must be connected between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from $V+$ to ground is applicable to single-supply applications.

BASIC AMPLIFIER CONFIGURATIONS

The OPA376-Q1 family is unity-gain stable. It does not exhibit output phase inversion when the input is overdriven. A typical single-supply connection is shown in [Figure 22](#). The OPA376-Q1 is configured as a basic inverting amplifier with a gain of -10V/V . This single-supply connection has an output centered on the common-mode voltage, V_{CM} . For the circuit shown, this voltage is 2.5V, but may be any value within the common-mode input voltage range.

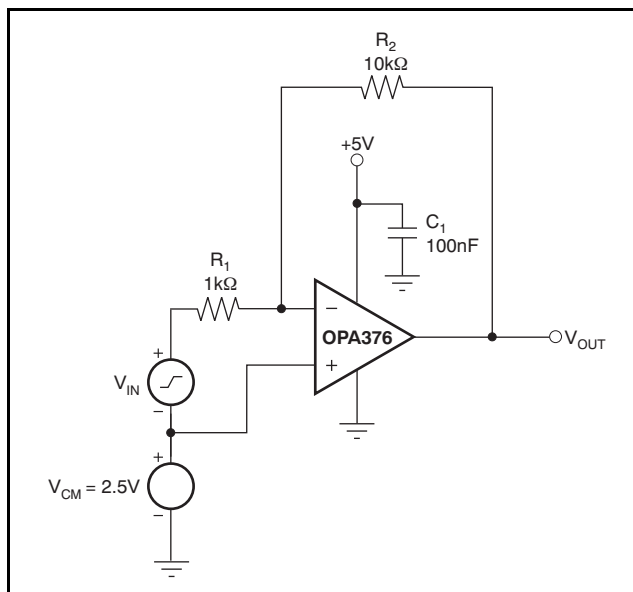

Figure 22. Basic Single-Supply Connection

COMMON-MODE VOLTAGE RANGE

The input common-mode voltage range of the OPA376-Q1 series extends 100mV beyond the supply rails. The offset voltage of the amplifier is very low, from approximately $(V-)$ to $(V+) - 1\text{V}$, as shown in [Figure 23](#). The offset voltage increases as common-mode voltage exceeds $(V+) - 1\text{V}$. Common-mode rejection is specified from $(V-)$ to $(V+) - 1.3\text{V}$.

Figure 23. Offset and Common-Mode Voltage

INPUT AND ESD PROTECTION

The OPA376-Q1 family incorporates internal electrostatic discharge (ESD) protection circuits on all pins. In the case of input and output pins, this protection primarily consists of current steering diodes connected between the input and power-supply pins. These ESD protection diodes also provide in-circuit, input overdrive protection, as long as the current is limited to 10mA as stated in the [Absolute Maximum Ratings](#). Figure 24 shows how a series input resistor may be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and its value should be kept to a minimum in noise-sensitive applications.

Figure 24. Input Current Protection

CAPACITIVE LOAD AND STABILITY

The OPA376-Q1 series of amplifiers may be used in applications where driving a capacitive load is required. As with all op amps, there may be specific instances where the OPAx376 can become unstable, leading to oscillation. The particular op amp circuit configuration, layout, gain, and output loading are some of the factors to consider when establishing whether an amplifier will be stable in operation. An op amp in the unity-gain (+1V/V) buffer configuration and driving a capacitive load exhibits a greater tendency to be unstable than an amplifier operated at a higher noise gain. The capacitive load, in conjunction with the op amp output resistance, creates a pole within the feedback loop that degrades the phase margin. The degradation of the phase margin increases as the capacitive loading increases.

The OPAx376 in a unity-gain configuration can directly drive up to 250pF pure capacitive load. Increasing the gain enhances the ability of the amplifier to drive greater capacitive loads; see the typical characteristic plot, [Small-Signal Overshoot vs Capacitive Load](#). In unity-gain configurations, capacitive load drive can be improved by inserting a small (10Ω to 20Ω) resistor, R_S , in series with the output, as shown in Figure 25. This resistor significantly reduces ringing while maintaining dc performance for purely capacitive loads. However, if there is a resistive load in parallel with the capacitive

load, a voltage divider is created, introducing a gain error at the output and slightly reducing the output swing. The error introduced is proportional to the ratio R_S/R_L , and is generally negligible at low output current levels.

Figure 25. Improving Capacitive Load Drive

ACTIVE FILTERING

The OPA376-Q1 series is well-suited for filter applications requiring a wide bandwidth, fast slew rate, low-noise, single-supply operational amplifier. Figure 26 shows a 50kHz, 2nd-order, low-pass filter. The components have been selected to provide a maximally-flat Butterworth response. Beyond the cutoff frequency, roll-off is -40dB/dec. The Butterworth response is ideal for applications requiring predictable gain characteristics such as the anti-aliasing filter used ahead of an analog-to-digital converter (ADC).

Figure 26. Second-Order Butterworth 50kHz Low-Pass Filter

PHOTOSENSITIVITY

Although the OPA2376YZD package has a protective backside coating that reduces the amount of light exposure on the die, unless fully shielded, ambient light can reach the active region of the device. Input

bias current for the package is specified in the absence of light. Depending on the amount of light exposure in a given application, an increase in bias current, and possible increases in offset voltage should be expected. Fluorescent lighting may introduce noise or hum because of the time-varying light output. Best layout practices include end-product packaging that provides shielding from possible light sources during operation.

DRIVING AN ANALOG-TO-DIGITAL CONVERTER

The low noise and wide gain bandwidth of the OPA376-Q1 family make it an ideal driver for ADCs. Figure 27 illustrates the OPA376-Q1 driving an ADS8327, 16-bit, 250kSPS converter. The amplifier is connected as a unity-gain, noninverting buffer.

NOTE: (1) Suggested value; may require adjustment based on specific application.

Figure 27. Driving an ADS8327

PHANTOM-POWERED MICROPHONE

The circuit shown in Figure 28 depicts how a remote microphone amplifier can be powered by a phantom source on the output side of the signal cable. The cable serves double duty, carrying both the differential output signal from and dc power to the microphone amplifier stage.

An OPA2376-Q1 serves as a single-ended input to a differential output amplifier with a 6dB gain. Common-mode bias for the two op amps is provided by the dc voltage developed across the electret microphone element. A 48V phantom supply is reduced to 5.1V by the series 6.8kΩ resistors on the output side of the cable, and the 4.7kΩ and zener diode on the input side of the cable. AC coupling blocks the different dc voltage levels from each other on each end of the cable.

An **INA163** instrumentation amplifier provides differential inputs and receives the balanced audio signals from the cable.

The **INA163** gain may be set from 0dB to 80dB by selecting the R_G value. The **INA163** circuit is typical of the input circuitry used in mixing consoles.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
OPA376AQDBVRQ1	ACTIVE	SOT-23	DBV	5	3000	TBD	Call TI	Call TI	

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
